> years ago TiFKAS would defend its constant attacking of Atari users in c.s.a.st (which was in violation of the newsgroup charter, which forbid "computer vs. computer" debates) by wrapping itself in the American flag and claiming that it was protected under the First Amendment of the US Constitution, which promises freedom of speech. When, however, I discovered that the US Supreme Court had ruled in 1974 (in the landmark case "FCC Vs. Pacifica" AKA "Pacifica Broadcasting's playing George Carlin's Seven Words You Must Never Say On Television") that public nuisances were not protected under the 1st Amendment and could indeed be subject to criminal and libel prosecution, and made that clear in that forum that TiFKAS defined "public nuisance" to a T, TiFKAS promptly shut up.

What dream was this?

> I find it interesting that TiFKAS is accusing you of being from Canada, Hallvard (notice the "up North" reference) -its known emnity to the Great White North is showing, due to the fact that a number of its most vocal critics who have totally humiliated it in exposing its vast ignorance of anything computer-related hail from there, often claiming we have a lousy "socialist government", are sinking economically, and are nothing more than "US-owned territory". It must really hurt it to discover that currently Canadian economic growth is larger than the US, not to mention that at least in our elections we can count, unlike in TiFKAS' US where they allowed the dumbest politician since Dan Quayle to become president due to a stupid concept like the Electoral College. (It's also funny that the newspaper it uses as "evidence" of the bad stuff about Canada, The National Post, is also considered a national joke which has bled red ink since its inception, and that its publisher, Conrad "Tubby" Black, has fled Canada with his tail between his legs out of shame).

Speaking of dumb politicians, you have one in your neck of the woods. What boob stereotyped Africa? All that money down the drain because he had a dream that a tribe was dancing around a big cooking pot being boiled with him inside.. I am sure that the business community is amused..

There is discussion of implementing user fees for visits to the health clinic. Seems that costs are spiraling out of control..

> > >> If you think you're bringing "Mac-evangelism" to the world you've truly misunderstood the whole concept and surely bring disgrace to the rest of your fellow Macintosh fanatics. If you believe your postings will bring Atari users to start using Macs you're dead wrong. Check your head man!

I was never on hot mail. You must mistake me with another. As for
cedarnet, I was never reprimanded with a letter... just a note that
there was a complaint. Replied to the complaint note... No violation

of usenet policies.   Don't know what they sent to you.. If this
standard was held up, usent would be as empty as the Aussie outback or
the Alberta province

Funny, I don't recall seeing those words in a message by me.

Typical of you, however, you seem to have a way of turning things around to fit
your agenda. When will you finally admit to yourself what everyone else has so
clearly explained and proved to you: you're an asshole.

I don't have an agenda.. Maybe it's the credibility of the rag with
lack of perspective and not believeing in the publication. Sounds like
an excuse.. Maccentral.com has done it...

I have been called worse. My critics come and go..

Keep telling yourself that you don't have an agenda, and you'll continue to believe it.

Excuses? For what? I've been doing this for well over 10 years now. All for free with no inclination to charge for it. We do it for the enjoyment and comraderie. There's nothing that implies a lack of credibility - our readership increases weekly.

Man, why are you even bothering?  Your responses sound like they're written by a
jr. high school kid.. of course, theirs would at least be funny/creative.  Give it
up.

Nor have you answered the question posed to you in the first place. Not
surprising
considering you haven't answered any of the other tough questions about your
outrageous bollocks.

> What ever..Only in your mind. You have issues with janitors or you
> acting macho disguised as one?
>

No not in my mind. This came up several years ago when you made your bogus claims of being employed at a university and implied you were a member of faculty. Until it was uncovered you're only qualifications might get you in as a janitor, nothing else. Of course this is yet another of the endless examples of you blowing smoke from every oriface to disguise your incompetance. But then to expect more of you is perhaps unfair considering your incurable stupidity and penchant for verbal flatulence.

> You answered! hi 'Chunks'!

Another example of tifkas many hallucinations. Talking to itself is one sign of mental instability desparately needing treatment. Even that is a slap in the face who've had benefit from mental health providers. Perhaps tifkas sole contribution to the world will be as an example in every chapter of the newest crop of psychiatric textbooks now used in med school.

>
> See ya in NYC later in the month..

No tifkas, you won't be seeing him or anyone else in NYC. to see him you'd have to go there yourself. Since its been proven time and time again that you fail to appear at macworld expo and any other trade show, its not surprise to realize you won't be at this one either. Take the hint, if you did go, you'd be quickly banished at the door. The Mac community doesn't want you, the Atari community doesn't want you. NOBODY WANTS YOU because your a useless idiotic blowhard.

So you know all of 'nobody'? Who are the identities in the mac and atari community that would deny me the entrance? Have been to more trade shows than you will ever have been to if ever...will make your head spin.

Nice prozac fantasy!

Yes, at one time I was employed at the University in the IT group at
the libr...as the lone mac(maytag)tech person. 90% of the time was
observing the legions of windoze techs going ga ga over the new windoze
95 at the time and continous trouble shooting of wintel 3 workstattions
in staff and public stations. Very hilarious... observing the mindset
of the IT beauracracy and job security..Had my token macs out on the
network by end of business day and begun the wait tech watch..Waited,
waited, waited, waited, waited and bing...the first tech call!!
Easiest money I made. Just a restart to fix the freeze... Afterwards,
my college party career had come to an end. Still paying off the
brewsky tab though.

Yes and a big brewski tab you have. Being a drunk would explain your aberrant stupidity. But I still wonder why you persist in this lie when it was disproven years ago. People have checked and you never worked there. But for us in the REAL
WORLD we dont go to college to party and be an idiotic buffoon as you are but to increase our knowledge. This is why your the only one clueless to one blinding fact, that is your own ignorance of the real world.

For the sake of argument let's suppose you could design a next generation $300 homecomputer. The goal is to make a userfriendly machine for general use and for hobbyists. How would such a system look?

CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this type of thing, you should be looking at the $20-35 level)
As OS? (Linux is a dead giveaway, but there also other OS's out there)
Build in programming language? (please choose anything but Basic!)
Amount of memory? (RAM and ROM)
Graphic and Sound?
Network capabilities? (internet capable)
Plug in capabilities (remember you're making it as cheap as possible so modems, CD-Roms, HD's are all extras)
Video (TV? or Monitor?)

Remember that the RETAIL price should be $300, so think in wholesale prices. The real costs should below $200 or even below the $150 level. You may presume that a million units would be manufactured so take volume discounts for components into account

Let's see what sort of systems people come up with.

>type of thing, you should be looking at the $20-35 level)

Well, in quantities, you might get pretty close for low end
Celerons....

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

FreeDOS?? It's getting closer to be usable everyday....
Linux for a home user, no way, not in this decade AFAIAC... ;-)))

>Build in programming language? (please choose anything but Basic!)
What's wrong with BASIC? It's easy to be "build in", as it is an interpreter and there are a lot of BASIC variations out there that would stand any comparison for ease of use and performance....
Or you you suggest something more academic like Smalltalk, Lisp or Java???
>Amount of memory? (RAM and ROM)
Not as much a question of cost (128MB SDRAM is less than $10 these days), as of a combination of the above specs...
>Graphic and Sound?
VGA style graphics with 4MB RAM and at least 800x600, 16bit colors is not a problem these days either..
And SB compatible sound probably not...
>Network capabilities? (internet capable)
an onboard solution with a Realtek chip and TP 10/100 RJ-45 connector...
>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)
>Video (TV? or Monitor?)
Well, a monitor is probably the most expensive part. As for the possible graphics capabilities, a TV (if it's not a fancy digital HDTV one) is far below the capablities of the graphics chips...
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
If you buy a million pieces of ANY component, you get FAR below the usual retail prices. a quick look on pricewatch reveals

CPU: AMD Duron 700Mhz	$24 (Celeron 700MHz $42, VIA Cyrix 700 $37)
Memory: 128MB PC133	$9
Mobo: Intel 810	$38 (build-in video!, USB, keyboard,...)
case w/ p/s	$25 (ATX desktop)

Ok, that is a pretty mix, bu assuming large quantities as you mentioned, this is less than $100 for the major parts. Add a few $10 for network and sound and smaller stuff, no problem...

>
>Let's see what sort of systems people come up with.
>
Ok, just a rough sketch, but it should give you an idea.
The problem is to finance this and to get the software for it (BeOS might be nice, but....)
And these days, you will have a hard time selling something that is not Playstation or PC compatible...
And than you are up against M$ with their XBox or whatever it is called these days......

just my 2c,

Ralf

You need to make your mind up. Either it's a toy - and at $300 retail
that's all you can aim for - or it's a computer for "general use and
for hobbyists".

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this

>type of thing, you should be looking at the $20-35 level)

Very cheap and weak Intel or AMD CPU's then. The alternative is to go with the stuff used in PDA's, but do you want to have a desktop or a PDA.

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Like QNX maybe, or a ported version of AmigaOS. Other alternatives rake you back to the PDAs.

>Build in programming language? (please choose anything but Basic!)

gcc for real programming, Perl for scripting.

>Amount of memory? (RAM and ROM)

Depends on the OS. No ROMs, they stink.

>Graphic and Sound?

There are plenty of cheap chipsets.

>Network capabilities? (internet capable)

Built-in 10/100 BaseT. Essential.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Don't be daft. There's no point making CDROMs and HD's "extras". What, you think people are willing to go back to swapping floppies?

>Video (TV? or Monitor?)

Again, are you after a computer or a toy?

>Remember that the RETAIL price should be $300, so think in wholesale prices.
>The real costs should below $200 or even below the $150 level. You may
>presume that a million units would be manufactured so take volume discounts
>for components into account
>
>Let's see what sort of systems people come up with.

What's the point? This is market research for the '80s. Nowadays people aren't satisfied with a cheap jack of all trades that doesn't do anything very well. They want a cheap games machine, they buy a console. They want a cheap general purpose computer, they get one. They want something cheap that does everything well, they get into a time capsule and go back to 1985.

Anyone aiming to produce computers that retail at $300 is going to be peddling a pile of camel dung.

Two points.

Firstly, what's so bad about Basic? It's entirely possible to write
structured programs in any decent dialect (BBC Basic being a case in
point), and the mere posession of a GOTO statement is not in itself the
mark of the devil.

Secondly, why does there have to be only one built in language? Look at
the BBC Micro - 4 ROM sockets (expandable to 16), allowing you to have
several languages resident at once, switchable by software commands (eg
*BASIC or *PASCAL).

[1] Yes, I do own one, and it's great.

Oh, I don't know... I'm using a nice ARM-based desktop box here...

>

It would probably look very much like the e--Machines system I just
bought my daughter to take to college with her.

600Mhz Celeron
32 MB RAM
8Mb SVGA Video integrated on motherboard
Soundblaster compatible integrated on motherboard
10 GB Hard Drive
16x DVD
Keyboard
Mouse

Cost? $269

(OK, I got a deal because these were "returned" systems from a company
that canceled a contract. They had to be sold as :"ref urbs" because
they weren't "new".   Big deal.)

Oh, and I added a 10/100 card for $14 and 256MB RAM for $55

She probably could have gotten by without the RAM, but why?

The price is in the $300 ball park and it's a system she'll be familiar with and can make instant use of. The software it runs will be compatible with most people she runs into in college. It has a software base that no new computer could challenge for decades.

>CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
>type of thing, you should be looking at the $20-35 level)

And looking at incompatibilities? Let's choose something no one else runs at present just to be different?   Something with no software base?   Something that will have to run an emulator (and slow it down) in order to have any programs to run?

>As OS? (Linux is a dead giveaway, but there also other OS's out there)

Gak. You said "userfriendly" up there. Linux is out.   Waayyyy out.

>Build in programming language? (please choose anything but Basic!)

Why not? BASIC is userfriendly. It uses natural language. It was designed to be easily usable.by anyone.

Why choose something that will only discourage users from learning it?

>Amount of memory? (RAM and ROM)

RAM is cheap. More is better. Decide on the actual amount at the last minute depending on the final cost of the unit. Put in as much as you can to bring the cost up to your final limit.

ROM is nice, but restrictive. Atari was hobbled by the difficulty of releasing bug fixes to its TOS operating system because the OS was in ROM. (Well, that was one of the reasons.)   But it was VERY nice to have the system boot in seconds.

>Graphic and Sound?

Yes, definitely.

>Network capabilities? (internet capable)

Of course.

>Plug in capabilities (remember you're making it as cheap as possible so
>modems, CD-Roms, HD's are all extras)

Why? When you can buy a system like I described above. Who is going to buy a stripped down box? Will it have a cassette interface?

>Video (TV? or Monitor?)

Using a TV will restrict the output to 40 columns.   Nice if you're
currently using a VIC-20, but who is going to do anything but play
8-bit games on a TV?

>

Well, I've already got mine.   (I'm designing roller coaster tracks
on it right now. I'll probably take that off before it goes off to
college with my daughter though.)

hmmm... I think "Next Generation" and "$300 Home computer" are diabolically opposed.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this
> type of thing, you should be looking at the $20-35 level)

AMD Duron 700MHz, 24 bucks. Powerhungry? who cares, I have a wall socket.

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Optional, included OS's are evil.

> Build in programming language? (please choose anything but Basic!)

"Next Generation" and "built - in" are diabolically opposed, why plan for obsolescence? (and what's wrong with Basic?)

> Amount of memory? (RAM and ROM)

256MB PC133CAS2, a whopping $50. To hell with ROM, ROM only seals the fate of the shortsighted. Anything "Next Generation" should have no ROM, hell, even the BIOS is going the way of the dodo.

> Graphic and Sound?

um, yes. ;)

> Network capabilities? (internet capable)

yes.

> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)

It's cheaper if they're NOT extra's.

> Video (TV? or Monitor?)

Grown men don't find sitting indian style on the floor in front of the family TV acceptable. Monitor, please.

> Remember that the RETAIL price should be $300, so think in wholesale prices.
> The real costs should below $200 or even below the $150 level. You may
> presume that a million units would be manufactured so take volume discounts
> for components into account

Why $300? If I want "Next Generation", I'm ready to pay for it. I'd rather pay $3G for a useable PC than waste $300 on something crippled to "cut corners" that doesn't do what I want. Money is /hardly/ an entry barrier these days.

> Let's see what sort of systems people come up with.

While interesting, the "Next Generation" PC will hardly be revolutionary because of its hardware or its cost. Both those barriers are /hardly/ barriers any more. The area society would most benefit is computer science research, Operating Systems and User Interface design are what will make something "Next Generation", not cheap hardware or retail price.

It should be small and cost-effecient. $300 is WAY too much. let's say $150 is quite affordable. Also it should be able to emulate numerous of those old home machines and the emulation be changed in software. Nowadays it is possible to make chips by programming them.

> CPU? (P.S Intel and AMD are out, far too expensive and powerhungry for this

> modems, CD-Roms, HD's are all extras)
> Video (TV? or Monitor?)

Cpu would be Western Desing Center 65816 and a z280 or a z380. Both would share the same memory, and there would be 16 megabytes of ram memory and bankable one megabyte of video memory (so that it can be mapped to either cpu's memory area). Also they could run their code simultaneously so that when the machine is emulating a 65xx machine, the z380 emulates the old chips in those systems while the 65816 runs the code. Also, when a z80 machine is emulated, the 65816 takes care of chipemulation. Also some of the memory would be relocatable in software so that the old chips, roms and so on can be easily emulated. The clock speed of both cpus should also be changable in software.

The programming language would be c++ or c or assembler. Also basic would be considerable. Only needed rom would be the code starter roms for both cpu's and a boot rom. The rest could be loaded from an ordinary ide hard disk drive. A dvd-rom would also be a good there; it can store much information and can possibly be used to watch dvd. Also if it is made bootable it would be fine.

As a graphic solution a svga driver chip would be superior. As a sound chip a creative sb16 chip would be fine. It has fm and 16 bit stereo dsp. A ne2k compatible rtl8019 would be fine for networks.

Weird. I think you should check out a recent Linux distribution.

(with apologies for the huge cut and past of one of my previous posts) CMD made an attempt with GUS - 3 x 65816 at 20Mhz, SCPU 128 architecture and some other neat ideas. The arrival of cheap PCs killed the project. The problem with cheap PCs is that their first-time owners tend to treat it as an appliance, and paying expensive bills to get problems fixed, or to purchase entirely unnecessary application software for more than the initial purchase price of the box.

One of my favourite "toys" was an old Dick Smith (Funway?) Electronics Learning Kit. It was a board with springs (to join the hookup wire), components, and project sheets. Simple, fun, and educational. Especially since there was no need for that ten-year old to to wield a dangerous soldering iron and play with mains electricity. Which leads nicely into...

If the C64 was going to be ressurected in a modern form, it would have to be something entirely different from a PC, and aimed at an entirely different market. A "learning" or "hobby" computer. Like "Mecchano" and IIRC "Lego Robotics".

Something that was:

a) Relatively inexpensive
b) Programmable
c) Childproof and newcomputerowner-proof
d) Expandable

What I'm thinking of is a SCPU-driven 64 in a PC mini tower, with real O/S that sits over the C64 BASIC/KERNAL package and provides a protected environment for a new BASIC or PASCAL with strong visual and audio support. A component system, similar to Borland's "Delphi" would be really nice.

The O/S would be scaleable -
* A "Childrens' Mode" which allows a subset of the programming languages and lots of presets for stuff like printer output, menu-driven educational titles, etc (in ROM?). Perhaps a point-and-click programming language with built-in music to make "games" similar to the old Commodore "babysitter" titles ala "Pinball Construction Set".
* A "Hobby Mode", perhaps using a hard-to-get-at hardware switch which allows access to the guts of the machine, and 64-mode, etc. A redesigned "hobby-port", basically the User port with build-in relays and perhaps a bay for a 9-volt battery to power plug-in (out of the box) hardware projects.

In all, a machine that the user can get a real feeling of being in control - no worry about viruses or crashes or constant version updates and patches. Something parents will buy for the kids as a toy but may (hopefully) discover than by plugging some extra stuff into it, can do basic tasks like wordprocessing and may not be quite the toy they thought it was.

First of all, it would be two different systems:

A "userfriendly machine for general use" could very well be a closed machine, like e.g. the early Macintosh models. The user just wants to use such a machine, without caring about the inner workings of it, much like you e.g. watch TV without bothering to understand how the TV set actually works.

A machine "for hobbyists" would be different: it would be open, well documented, expandable, etc -- more along the line of the Apple II or the PC's. This machine is for people who want to poke around in it.

An internet project already exists for a "Next Generation" CPC computer, which will use an eZ80 processor (Z80 compatible), run old CPC software, be open, have a new operating system etc. See web page at http://cpcng.free.fr/ or mailing list archives at http://groups.yahoo.com/group/CPCNG (a bit quiet recently).

A PowerQUICC 862 (I'm not sure I've got the number right)
> As OS? (Linux is a dead giveaway, but there also other OS's out there)

go for linbux, it's easiest.
> Build in programming language? (please choose anything but Basic!)

why bother, just stash gcc on it's HDD
> Amount of memory? (RAM and ROM)

dunno, the stuff's dirt cheap, prolly somewhere around 32MB.
> Graphic and Sound?

Half inch a cheapo PCI SVGA chip and stick an AC97 codec on one of the PowerQUICCs
serial ports.
> Network capabilities? (internet capable)

Make use of another PowerQUICC serial port.
> Plug in capabilities (remember you're making it as cheap as possible so
> modems, CD-Roms, HD's are all extras)

SCSI and USB. I would *not* make an HDD an extra. They're cheap enough anyway, for
a small one.
> Video (TV? or Monitor?)

Both standards, but supply neither.

No, they're cheaper these days.

What with them being a lot smaller, efficient, cheaper to produce, etc.

And I'm surround by two MIPS boxes (One is admittedly a PSone, the other is significantly cooler - an SGI Indy), one SPARC box (SPARCstation IPX) and one SuperSPARC box (SPARCserver 10).

These might not be be spanking new architectures, but they're superior in every way (expect sheer clock speed) than any Intel/clone box I've seen.

|$300 homecomputer. The goal is to make a userfriendly machine for general
|use and for hobbyists. How would such a system look?

A box with a whole bunch of ports that all looked like 'phone jacks' and was intelligent enough to tell the user (with a speech synthesizer) what was available at each port.   If you needed to pass through more data than usual, just use more phone jacks. Yep, phone jacks all over the place. Just about *anybody* can figure out how to plug jacks in. But it is very human to plug the wrong things in to the wrong sockets, so use the speech synthesis to tell him what's wrong. Oh, and the audio ins and outs would be through phone jacks, too.

And when it powers up properly, and is sufficiently initialized, says something like "Computer Okay."

|jacks in. But it is very human to plug the wrong things in to the
|wrong sockets, so use the speech synthesis to tell him what's wrong.

And what's right. You see, that's part of the initialization procedure. For instance, if the Box ends up saying "Waiting for Port 1 Jack" the user knows that something is up right there.

|Oh, and the audio ins and outs would be through phone jacks, too.

Yep, phone jacks all over the place.

|And when it powers up properly, and is sufficiently initialized,
|says something like "Computer Okay."

As for speech recognition, or maybe just whistle recognition, that's a whole 'nother ball o' wax. The manufacturer would be shooting himself in the foot if he requires the user to input data (er, ah, select games or applications) by whistling.

Interesting, I had a similar kit with a board, springs, components and project sheets. You could upgrade the entire board to a full experimental control system complete with well written manuals (even for a kid) how to build and design assorted circuits. Cool stuff. :-)
You could find them in some of the larger electronics stores but I haven't seen one in years (sigh). I don't remember the name but it came from a german company, the boxes they came in were orange with electronics and schematics on them.

So it should be aimed as an educational toy/tool. Seeing the cut throat PC business this would be a sensible approach.

Having used Pascal myself I would have to agree on using a system like
Delphi. Although my heart these days is with Python. But that's a script
language (I wish i had this as a kid, so clear and well structured!)

At least it would be a better investment than the newest game console on the
block. What parent could resist?

Cheers,

Post # of 82323

  You'll be sick of me in no time. I'm going to ruin this board for you
just like
  I did over at Motley Fool and Yahoo! I've got plenty of time on my
hands and I'm
  going to post incessantly! Every time I find some small issue with an
Apple product
  you're going to see it posted here dozens of times of times. You're
going to have
  to wade through my Apple bashing garbage just to read the few posts
you want
  to see from the people you wish to communicate with. Start ignoring
my posts
  now because I'm that annoying!

  Karmi
  Spewer of Garbage
```

Replace the word Apple with Atari and that looks to me like a very good description of your posting style.

Regards,
David Bolt

          The LGPL does infact tend to be used instead of the GPL in instances
          where merely reusing a component, while not actually altering that
          component, would be unecessarily burdensome to people seeking to
     build their own works.
```

```
          This dramatically alters the nature and usefulness of Free Software
          in practice, contrary to the 'all viral all the time' fantasy the
          anti-GPL cabal here would prefer one to believe.

     Not everything can be magically transformed into the equivalent
     altivec code. OTOH, you can get dual 1.5Ghz PC's now and you can
```

get CHEAP 1.3Ghz Athlon systems as well.

Apple simply isn't keeping up. At any pricepoint, PCs can beat Apples by a wide margin. This margin grows as the Apple reference systems in question increase in cost.

--

Also while the herd mentality is certainly there, I think the nature of software interfaces and how they tend to interfere with free choice is far more critical. It's not enough to merely have the "biggest fraternity", you also need a way to trap people in once they've made a bad initial decision.

I've scrolled web pages just fine on some really skanky PC hardware running on really crusty old PCs (486 VL Bus).

[deletia]

An 040 is more than enough for the web, even with the crappiest video chipset you can come up with.

You can even get consumer PCs in that sort of configuration, and even build your own "bookpc". My wife's WinBox is just such a machine.

Your standard for web browsing must be moderate, then. When I use a 486SLC-2 system with 8Mb of RAM, a 512K VLB video card (Cirrus Logic chipset, I believe), and a 28.8 modem, I get some fair scrolling, but far from smooth in my estimation. I believe more RAM and a slightly better video card would do the trick, however.

Jared

No video ram isn't the answer. I actually get annoyed by people who insist
it does. It will only improve your colour depth. A faster video card or
faster bus is the cure. Pc's suck.

Why should they? Speed isn't every thing. What about efficency? If a piece
of mac software can do something in half the time as an equivelant PC that
would be enough for me. Incedently there is a dual Athlon chipset being
produced too;-) Bye bye intel hahahahaha

Being that MacOS can't multitask for shit, efficiency isn't a strong point either.

(That can be fixed by using Linux, but then running Linux on a PC would be a cheaper and more effective option)

Regards,

Clockmeister.

Hmmm, on a Mac no doubt it does - but I was talking about a platform with
real support for alternative OS's and software.

Not that I'm a Linux fan...

Regards,

Clockmeister.

Lot of the unix types may go X. The major software firms will have X
apps in the days, weeks and months ahead. Incredible support. Waiting
for Carmack's offerings...

Mac OS X vs. Linux: Could Apple Take a Bite Out of the Penguin?

by Chuck Toporek, O'Reilly Open Source editor
<http://mac.oreilly.com/news/macosx_0301.html>

Is Mac OS X a Threat to Linux?

On March 24, Apple Computer, Inc. released its next-generation operating system, Mac OS X (the "X" is pronounced as "ten," for the version number of the operating system) to Mac addicts around the world. While this isn't such a big deal to some, others view it as a new beginning that could squash all thoughts of a desktop Linux for the general public.

What's this, "Apple out-maneuvering Linux?" you say? Well, maybe not as a server platform for the immediate future, but just think about this for a second: Would it be possible for Apple to deflate the hopes and dreams of developers worldwide of bringing Linux to the desktop? The short answer to this is yes, but it's more complicated than that.

Comparing Apples with Penguins

Aside from the fact that an apple is a fruit and a penguin is a flightless waterfowl, there used to be a big difference between the Apple Macintosh operating system and Linux. Apple had a nice GUI; Linux did not. Linux had a command line; Mac OS did not. Linux is a multitasking OS that supports multiple processors; Mac OS is not. Linux runs on just about anything these days; the Mac OS runs on, well, Apple equipment. Linux is free (well, sort of, depending on your method of install); Mac OS X will set you back $129.

So, the lines were pretty clear about the differences between Linux and Mac OS. But lately, that clarity has been blurred as Apple rolls out Mac OS X to the public. The new Mac OS now has preemptive multitasking and support for up to two processors, which is still a far cry from Linux's support for up to 16 processors, but it's a move in the right direction.

Traditionally, the only control Apple users had over their system was via the Control Panels and scripting system functions with AppleScript, MacPerl, or ResEdit. However, with Mac OS X's BSD base, Apple users were given something they've always wanted: a latch to take a peek into Apple's core.

At the core of Mac OS X is a kernel built on the Mach 3.0 kernel, BSD 4.4, and Darwin (Apple's open source kernel project), giving network and system administrators the ability to use Unix programs and add them to their Macs. When combined, these components offer a rock-solid operating system that's hard to beat. (OK, I know that Mac OS X has its fair share of bugs, so no flames, please.)

One of the advantages of Mac OS X is that it now offers Macintosh users with a command line on top of a slick, stable GUI, known as Aqua. With OS X's BSD core, Macintosh users will now be able to use GNU software. This means they will be able to run tools like Emacs, vi, Apache, and even XFree86 and the GIMP (something that Adobe Systems should fear). If you're looking for a place to download ports of GNU tools that run under Mac OS X, you should visit the GNU-Darwin Project on SourceForge.

One of the downsides of OS X is that it requires you to have a native G3 or G4 processor. This means you have to be running a G3 Mac, an iMac or iBook, a PowerBook G3 or better, or any of the G4 models and above. So, if you have an older 604 PowerPC-based Mac, you can't run OS X (that is, unless upgrade manufacturers, such as Sonnet Technologies release updates to their processor software). For now, though, if you want to run OS X your best bet is to run it on native hardware.

One group that stands to lose a chunk of the market is the Mac-based Linux distributions, such as MkLinux, LinuxPPC, or Yellow Dog Linux (YDL) from Terra Soft Solutions. Up to now, these were your best options for running Linux on the Mac, with LinuxPPC and YDL leading the pack. But OS X changes this landscape significantly. The downside to running Linux on your Mac in a dual-boot configuration (as with Windows) is that if you want to access any of your Mac apps, you had to either reboot, or install and run Mac-On-Linux. Neither option is ideal, but now OS X allows you to work in the command line, and run your Mac apps right along with them--no rebooting required.

And if you're wondering whether you can run the X Window System on top of Mac OS X, take a look at the XonX Project, which offers instructions on how to install XFree86 so you can run X Windows on Mac OS X. You can also read more about the XonX Project on SourceForge.

A Tale of Two (or Three) Desktops

So how does this make Mac OS X a threat to Linux? If you've given this any thought, the answer is quite clear. One of the challenges that the Linux community has been plagued with in recent years is the development of a stable and easy-to-use GUI. While some view X (or any GUI) as a hindrance to Linux's performance, a usable interface is a necessary evil if you want to convert users from Windows. And while the Linux kernel might be stable, the GUIs are, at times, buggy and less desirable for most people.

There are two main Linux GUI projects underway, GNOME and the K Desktop Environment (or KDE). There are also two companies vying for bragging rights to bring services to the GNOME desktop: Ximian (formerly known as "Helix Code"), and Eazel.

While Eazel isn't necessarily a desktop environment (DTE) on its own--it's a file manager (Nautilus) for use with the GNOME desktop--it plays a vital role in shaping the future of the desktop for Linux. The driving force behind Eazel is Andy Hertzfeld, the originator of the Mac user interface, and his plan is to make Linux more "usable" for the average Joe. While Eazel has been doing some really fantastic work, it has recently been hit with the deadly Silicon Valley bug, which forced the company to let go of 50 percent of its staff shortly after releasing Nautilus 1.0. Now, part of this can be attributed to lagging development with the GNOME desktop and changes to Bonobo (the GNOME architecture for creating reusable software components), but it's still a painful experience that makes us realize that Linux on the desktop is further away than we had all hoped.

Both KDE and GNOME are working on providing a better Linux desktop: KDE2 was recently released, as was GNOME 1.4. But both rely on different toolkits for development, both have different features, and neither is really all that stable. For example, the GNOME 2.0 desktop, which was expected to be out by the end of 2000, is faltering and probably won't see the light of day until near the end of 2001. The bigger issue is that as the Linux desktops stabilize they still have one problem to overcome: limited applications for users.

GNOME and KDE both have Office-like application suites in the works. KDE offers KOffice, and GNOME offers a combination of AbiWord for word processing, Gnumeric for spreadsheets, and a variety of other tools. However, the main contender for Office-like applications is StarOffice, which is now being developed by Sun Microsystems' OpenOffice project. Sun acquired StarOffice last year from StarDivision, and made its source code available to allow further development. Even StarOffice (at least in its current form) has its pitfalls, making it a suitable option for swapping Microsoft Office files, but only if you're willing to lose some vital information or do without a certain level of functionality.

In my opinion, Apple's Mac OS X has the best of both worlds. It allows you the ability to run traditional and widely used desktop applications, such as Microsoft Office, while at the same time giving you the power and strength of BSD Unix to run GNU tools under (or on top of) OS X.

As you can see, Linux has a way to go before it can truly be accepted as a desktop platform. Users need a more stable desktop and applications that work better with what 90 percent of the world uses. We're getting there, but realistically, it'll be two or three years before we start to see Linux being used more on the desktop.

So, will people start to move away from the "Linux-on-the-desktop" mentality and migrate to Apple's Mac OS X? It's hard to say, since it still requires you to have native Apple G3 or G4 hardware. If Apple were to migrate its OS onto x86 hardware, yes, Apple could take over the desktop market with Mac OS X. Apple just has to play its cards right--and soon.

If you're looking for a place to download ports of GNU tools that run under Mac OS X, you should visit the GNU-Darwin Project on SourceForge.
>
> One of the downsides of OS X is that it requires you to have a native G3 or G4 processor. This means you have to be running a G3 Mac, an iMac or iBook, a PowerBook G3 or better, or any of the G4 models and above. So, if you have an older 604 PowerPC-based Mac, you can't run OS X (that is, unless upgrade manufacturers, such as Sonnet Technologies release updates to their processor software). For now, though, if you want to run OS X your best bet is to run it on native hardware.
>
> One group that stands to lose a chunk of the market is the Mac-based Linux distributions, such as MkLinux, LinuxPPC, or Yellow Dog Linux (YDL) from Terra Soft Solutions. Up to now, these were your best options for running Linux on the Mac, with LinuxPPC and YDL leading the pack. But OS X changes this landscape significantly. The downside to running Linux on your Mac in a dual-boot configuration (as with Windows) is that if you want to access any of your Mac apps, you had

> to either reboot, or install and run Mac-On-Linux. Neither option is ideal, but now OS X allows you to work in the command line, and run your Mac apps right along with them--no rebooting required.
>
> And if you're wondering whether you can run the X Window System on top of Mac OS X, take a look at the XonX Project, which offers instructions on how to install XFree86 so you can run X Windows on Mac OS X. You can also read more about the XonX Project on SourceForge.
>
> ## A Tale of Two (or Three) Desktops
>
> So how does this make Mac OS X a threat to Linux? If you've given this any thought, the answer is quite clear. One of the challenges that the Linux community has been plagued with in recent years is the development of a stable and easy-to-use GUI. While some view X (or any GUI) as a hindrance to Linux's performance, a usable interface is a necessary evil if you want to convert users from Windows. And while the Linux kernel might be stable, the GUIs are, at times, buggy and less desirable for most people.
>
> There are two main Linux GUI projects underway, GNOME and the K Desktop Environment (or KDE). There are also two companies vying for bragging rights to bring services to the GNOME desktop: Ximian (formerly known as "Helix Code"), and Eazel.
>
> While Eazel isn't necessarily a desktop environment (DTE) on its own--it's a file manager (Nautilus) for use with the GNOME desktop--it plays a vital role in shaping the future of the desktop for Linux. The driving force behind Eazel is Andy Hertzfeld, the originator of the Mac user interface, and his plan is to make Linux more "usable" for the average Joe. While Eazel has been doing some really fantastic work, it has recently been hit with the deadly Silicon Valley bug, which forced the company to let go of 50 percent of its staff shortly after releasing Nautilus 1.0. Now, part of this can be attributed to lagging development with the GNOME desktop and changes to Bonobo (the GNOME architecture for creating reusable software components), but it's still a painful experience that makes us realize that Linux on the desktop is further away than we had all hoped.
>
> Both KDE and GNOME are working on providing a better Linux desktop: KDE2 was recently released, as was GNOME 1.4. But both rely on different toolkits for development, both have different features, and neither is really all that stable. For example, the GNOME 2.0 desktop, which was expected to be out by the end of 2000, is faltering and probably won't see the light of day until near the end of 2001. The bigger issue is that as the Linux desktops stabilize they still have one problem to overcome: limited applications for users.
>
> GNOME and KDE both have Office-like application suites in the works. KDE offers KOffice, and GNOME offers a combination of AbiWord for

> word processing, Gnumeric for spreadsheets, and a variety of other tools. However, the main contender for Office-like applications is StarOffice, which is now being developed by Sun Microsystems' OpenOffice project. Sun acquired StarOffice last year from StarDivision, and made its source code available to allow further development. Even StarOffice (at least in its current form) has its pitfalls, making it a suitable option for swapping Microsoft Office files, but only if you're willing to lose some vital information or do without a certain level of functionality.
>
> In my opinion, Apple's Mac OS X has the best of both worlds. It allows you the ability to run traditional and widely used desktop applications, such as Microsoft Office, while at the same time giving you the power and strength of BSD Unix to run GNU tools under (or on top of) OS X.
>
> As you can see, Linux has a way to go before it can truly be accepted as a desktop platform. Users need a more stable desktop and applications that work better with what 90 percent of the world uses. We're getting there, but realistically, it'll be two or three years before we start to see Linux being used more on the desktop.
>
> So, will people start to move away from the "Linux-on-the-desktop" mentality and migrate to Apple's Mac OS X? It's hard to say, since it still requires you to have native Apple G3 or G4 hardware. If Apple were to migrate its OS onto x86 hardware, yes, Apple could take over the desktop market with Mac OS X. Apple just has to play its cards right--and soon.

I'm trying to make st bootable floppies of .st disk images using makedisk.

The formats makedisk detects and trys to use for the disks are often 800-820 k in size, and the disks never work cos there are too many errors.
I'm aware that automation etc used odd formats to get a lot on a disk, but it seems odd.
Does anyone have any success in using this prog?

Because it's standard spammer reverse psychology, he or she seems to
be complaining so you go look to see what's so bad about the site.

   actually, The iDiot Forever Known As Sinclap is an endangered
species, namely the Drooling Mac Zealot. Its species has since evolved
past it into somewhat more informed, tolerant creatures (indeed,
recently MacAddict magazine proclaimed people like Sinclap to be nothing
more than dinosaurs whose puffing and insult tactics in public forums
like c.s.a.st are an embarrassment and a detriment to Mac evangelism).

Even those in comp.sys.mac.advocacy who have made the rare glimpse of Sinclap in that forum realize that it's a maroon, especially in light of its recent pronouncement that all Macs that use a 680x0 processor are "junk".

It could be possible that Sinclap may be doing its usual puffing and bellowing in order to find a mate, since human females have rejected its pathetic advances once they realized it had been disqualified from the human race for shoving! :)

I propose that we set up a fund where Sinclap be tranquilized, captured, tagged and set inside a proper enviroment where anthropologists may observe its actions - like, let's say the Mac section of CompUSA. Or even better yet, in a cage at this year's Macworld Expo in New York, where higher evolved Mac Users may wonder at how such a creature could exist without smothering on its own hot air, or why this one didn't jump off a cliff in order to get away from the imaginary "Atari Jihads" who were "out to get it".

Dan,

I have to say to say that I really enjoy your TIFKAS comments. Usually, I feel that such comments are warranted for a short time and then become boring and simply spiteful because the "victim" finally shuts up. But Sinclap just doesn't know when to be quiet and continues to be a pimple on society's butt. He deserves all of the "accolades" afforded him. Thank you for continuing to bear that torch! <vbg>

Looks to me like all you're doing is glancing through the magazine teasers and formulating an opinion - a wrong one, that is. I suggested to you before, read the magazine before opening up your yap.

As a magazine, we report the news, not invent it. We'll leave imagination to people like you.

-Dana @ A-ONE

>Your saying zdnet is crap?

Re-read what I said, it's above. Are you saying that everything included
within ZDNET's news is something the majority of people are interested in
reading? I didn't think so.>> >Let the Pros be..
>>
>> Let 'em be what?
>
>So how many trade/developer conferences and media events have you
>attended?

To be perfectly honest, none. When you start paying me a comparable living wage for putting out A-ONE, I'll be more than happy to attend the shows and write 'em off on my taxes. And, you may as well pay my staff while you're at it.

Hi Daniel,

>I propose that we set up a fund where Sinclap be tranquilized,
>captured, tagged and set inside a proper enviroment where
>anthropologists may observe its actions - like, let's say the Mac
>section of CompUSA. Or even better yet, in a cage at this year's
>Macworld Expo in New York, where higher evolved Mac Users may wonder at
>how such a creature could exist without smothering on its own hot air,
>or why this one didn't jump off a cliff in order to get away from the
>imaginary "Atari Jihads" who were "out to get it".

THANKS !!!!
After a very lousy weekend, where everything that could possibly go wrong,
went wrong, reading your posting brought back a a very *big* smile on my
face... :-)

Any idea how to capture it? To lure it out of it's cave we may have to

spread a hoax story... something like "the Milan III has landed", it'll be
very hard for this creature to withstand the temptation and come and see
the latest weapon of the Jihads... since it seems to be a keen and very
loyal reader of the A-ONE magazine it's obvious that the story should be
published there as an exclusive... the Sinclap creature seems to like
exclusives.
Oh yes... once it's captured it should be put in quarantine for at least
six months, just suppose it spreads something contageous!! we don't need a
second Sinclap do we?
Reflecting on this: we better have it sterilized as well, but only in case
it turns out to be a fertile specimen of course.

Cheers from Belgium
Dennis

Dennis,

I would certainly be happy to play a role in this "creature hunt" and would offer the services of A-ONE by carrying the bait, er story. <vbg>

-Dana @ A-ONE

BTW, I think sterilization is the proper path to take once it's captured!

ZDNET is read by millions. Instant stories not yester week's news
gergitating. They catch the mood and flavor of trade shows espicially
the ones I attend.

Hey Tifkas

>
> For the same price or more yesterdecade technology at a G4 price does
> not compute..

As usualy your response isn't even a coherent sentence. None of my Atari gear cost me that much these days. Come to think of it my atari gear are all systems, no paying $100 for usb hub to connect more than 2 devices to the system and no paying $89.95 for a floppy drive that should've been included with an iMac in the first place. So before you shoot off your mouth again, get a clue.

Hey Tifkas,

What trade shows and press conferences have you attended in the past year? I can answer that for you.... NONE!

And thats the way it will remain since you'd actually have to leave the basement of your parents house all these years. But then you'd run the risk of actually meeting one of the many people you've annoyed with your petty diatribes.

Oh and one more thing, Dan made a good point that several mac using friends of mine have confirmed. That is legit mac users really do regard you as at best a clueless vidiot.

Hi Guys,

This may have already crossed your minds but the ultimate Tifkas bait would be an upgrade to OS X featuring GEM as the default desktop. The main problem of the tranquilizer is how it could be delivered to the basment of Tifkas parents house (aka the lair of the beast).

Quick question:
I have an Atari 800XL system with a cartridge slot. Which cartridge format
(2600/7800 etc) can I use with it? Normally I load games with my floppy
disk drive, however it would be nice to have cartridges as well.

Your help is appreciated.
TIA!

The computer industry as a whole slowed down. You did not forget did ya?

> Sorry guys and gals, but the iMac boom is over. Better go out and find
> some REALLY cute new colors! Quick!

In your dreams..Apple knew Q1 would be rotten and decided to put the breaks on production to keep inventory lean and not have bloated inventory problems at the first of the new year. Apple disposed an additional 300,000 units during Q1. Reports indicate that iMac inventory is difficult to come by as a result.

> And the Cube? 107,000 sold in the launch quarter, then a paltry 29,000
> in Oct.-Dec. This puppy will get dropped. It's worth about $799, and

> some outright give-aways? Maybe, but as likely is that there is
> something strange in the Cube's $sales numbers obtained by maccentral

I disagree. I think $1299 is the proper price considering that the new
G4/466 is now $1699.

> All in all the article paints the current situation at Apple more

> their fabled $4,000,000,000 in hoarded cash extracted from loyal, but
> incredibly naive, customers bring them through this crisis? Tune in
> next week for the next episode of the Crash in Cupertino!

Apple has disposed their inventory issue, did you not forget? You
should be worried about HP, Compaq and GTW inventory bloatness..

I have listened to MOTU gear run from iMac via USB. STILL
the MIDI timing is bullshit. If MOTU and Apple can get a
solution running that bests the ultimate quality of MIDI
running on my Falcon, I'll change...'til then piss off!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

After Years of ATARI use my Falcon Rack is my favorite music computer.
UnstableSometimesBreaks interfaces for MACWINCRAP computers SUCK.
IF YOU CAN BURN A CD AND RUN YOUR MIDI INTERFACE together You should be
awarded.
P.S. My ATARI STACY is still the only Laptop with built in MIDI beside
an old Yamaha dos laptop.
GEEEEEEE I need a Faster computer to make Faster Music.

so much fer sincrap claimin' dat crapple do better - despite da gingerbread an' the attempts ta play catchup wit' rest of PC World, dey're goin' furder down da crapper. Down 57% in americas, down 48% in europe, down 80% in japan.

perhaps now dat dum loser troll admit defeet an' crawl back under his rock?

We all know Apple has had been going through some ruff times, but it still interesting to see the actual numbers. You can find the report at http://biz.yahoo.com/e/010212/aapl.html

Here's the breakdown by region. I wonder if Altivec is even powerful enoungh to even keep counting up all these losses?

AMERICAS AND EUROPE

The operating results of these two segments reflect the Company's overall results. Net sales in the Americas segment during the first quarter of fiscal 2001 decreased $676 million or 57% compared to the same period in 2000. Macintosh unit sales in the Americas decreased 54% on a year-over-year basis. Net sales in the Europe segment decreased $300 million or 48% during the first quarter of 2001 as compared to the same quarter in 2000, while the segment's Macintosh unit sales decreased 41%. These two segments combined represent approximately 83% of the Company's total net sales during the first quarter of 2001 and account for approximately $103 million of the Company's total operating loss for the first quarter of 2001.

JAPAN

Net sales in Japan declined 80% or $328 million and Macintosh unit sales declined 74% during the first quarter of 2001 as compared to the same quarter in 2000. The Company's Japan segment was most impacted by the Company's plan to reduce channel inventory during the first quarter of 2001 which is reflected in the 91% decrease in unit sales of iMac in Japan during the first quarter of 2001 compared to the same quarter in 2000.

The whole PC industry ended the last three months of 00 in the
dooldrums.  Apple ended the year with 5.5 weeks of inventory down from
12.  Drying the channel and creating cash on hand is the plan.

Apple's inventory was low in Jan which would be the reason for the
decline of sales..

Nice Try...

look like crapple still snail compared ta Pentium, accordin' ta professional Carmack. look like sincrap need ta find life.

http://www.insidemacgames.com/news/story.php?ArticleID=2184

Carmack on the 733Mhz G4:

"We did a ton of testing the last two weeks while we were putting the demo together.

The 733 G4 was not as fast as my 1 ghz PIII in any of the trouble areas.

Apple is doing a lot of good work, but the CPU's just aren't as fast as the x86 ones.

AltiVec can compensate in some cases, because it is way, way easier to program for than SSE, but it takes a very simple batched, computation intensive task for it to pay off in any noticable way.

Amdahls law and all that.

We did a couple functions with AltiVec, but they didn't make much difference.

Video encoding and large image processing are two areas that it can pay off, because you may be spending 90%+ of your time in one page of code.

Even then, it takes a special balance to let a G4 come out ahead, because it has less memory bandwidthd than a high end x86 system."

I recall a time, not too many months, when I got everyone into a fury over my desaire to see Atari reborn. Well, that *may* still be possible, but I'm not going to tout it with any conviction unless I get a reply from Infogrammes stating something positive towards my inqury to them.

However, I am here now, to state with utmost certainty, that a 68040-based Atari system CAN get be used to browse the Internet perfectly fine...

In theory.

You see, if the 68040 and a 486DX are theoretically similar, then the fact that I am using a 486 to browse the Internet, means that a 68040 should also as well.

It comes down to only a few things you need.

1) A good OS that doesn't eat tons of RAM nor take up tons of HD space.
2) A good Web Browser that does likewise.
3) a nice, relatively fast hard drive (420Mb or so is fine)
5) a 2-4Mb accel. 2D video card (or chipset) with drivers for said OS
6) a 56Kbps modem

This setup (I'm using a 486DX2-66 with Win95/Internet Explorer, 16Mb of RAM, 420Mb IDE HD, a 2Mb ATI Mach32 video subsystem, and 28.8Kbps modem, etc). I fully plan to prove that such a minimal system can, indeed be used to browse the Internet just as well as a completely decked out modern system.

With that done, I may decide to implement my findings in some other way...

Jared

Nice to have you back. You are correct about the Atari browsing the Internet. My system works great and I have 060 processor. Even my STe did a fair job...

Does the Milan040, when browsing web sites, stutter (i.e. not scroll pages
smoothly) when scrolling web pages? This is usually caused by an
insufficient video subsystem that can't handle the video bandwidth.

Jared

I do not know about that, but on the Hades 060 the scrolling is smooth...

I would say it's pretty smooth, about the same as my PB 1400.
If there's a lot of animated GIFs, one will see some "stutter".

I have recorded a sample "radio ad" for Atari. I'm going to save it to floppy and submit it to Infogrammes in a few days. Here's to hoping they like it and decide to do something positive with my ideas/suggestions.

Naturally, I relinquished all ownership of contents, in the letter, just in case they have a "no outside subbmissions accepted" policy, which would probably kill the letter before they even listened to the audio file!

If anyone wants to hear the 30+ second spot I recorded, just ask. I'll Email it to you. It's about 800K in size. It sounds pretty bad (audio quality-wise), but I think it really expresses the excitement I think Atari's revival could bring to the masses...

Jared

Ok, I'll bite...
Send away... I'll be honest in telling you what I think of the ad ;-)

Regards,

Clockmeister.

there actually is only one drooling idiot pro-Mac troll I know of. His name's Peter Sinclair, but he more commonly goes under the name "sinclap". The funny thing is, he doesn't frequent the Mac or Windows forums at all, but he resides in most of the Atari forums, mostly comp.sys.atari.advocacy (he USED to pollute comp.sys.atari.st as well until he was reprimanded by his ISP at the time for violating the group's charter against MCIBTYC posts).

sinclap's main angle of attack is calling all Atari users "jihads" and ridicules them for still using their legacy systems. He also claims to be an "Apple Power Rep", employed in some way to sell Macs, however his extreme stupidity and his lack of spelling skill belies the fact he'd have a hard time holding a janitorial position much less a position selling any sort of computer, and he absolutely refuses to give any proof of his employment.

He's also a very poor debater - when he's shown up for the vast number of mistakes, gaffes and outright lies he's made, he immediately goes into personal attack mode, which includes attacks against personal appearance, obesity, sexual proclivity (he considers himself quite a "stud", forgetting to put in the "pi" in the middle) and working position. Indeed, what is most funny is his many tirades against Canada, which is where the majority of his most mortal "enemies" reside - he's suffered a lot of damage when he's done that.

Since he's been around doing the same sort of thing for the last eight years, Atari users consider him these days to be nothing more than someone to have sport with - they find it fun to poke this troll with sticks until he squeeks. And the number of Mac users who've run into sinclap are surprised that someone who claims on his side can be so dense - he's even gone as far as saying that all 68K Macs are junk and should go into landfills, he's claimed that Mac OS 8 was pre-emptive multitasking, etc. ......

In other words, he's pretty much proved himself to be a premier crank and a "kook". :)

Maybe Mayor would like to debate sinclap? It wpould give Mayor a chance to debate someone his own age and IQ, and his own home state (sinclap hails from Indiana as well).

I have seen him flit through here on great occasion, typically dogging you (IIRC). There's another pro-Mac troll ranging through Usenet who's just about as dense, and here's what I think we should do about them. We should take up a collection, buy them PCs running Win2K, and replace their glasses with inward-reflecting mirrors to replenish our dwindling supply of windroids. Actually, this would be very inexpensive since it's the lobotomy that is the expensive portion of the conversion and it seems these Mac trolls have already had that done elsewhere ;-)

>
> sinclap's main angle of attack is calling all Atari users "jihads" and ridicules them for still using their legacy systems. [...]

Yes, I'm going to insist this collection start right away <g>.

[...]

> Maybe Mayor would like to debate sinclap? It wpould give Mayor a chance to debate someone his own age and IQ, and his own home state (sinclap hails from Indiana as well).

Does sinclap live downwind of the Mayor? That would explain a lot! ;-)

[I'm making light of this guy, Daniel, but I earnestly hope _you_ don't take offense. I grok that sinclap's irritated you... but take it from

an old sporker: they can shoot, but only you can let them score.
Laughing at him is the best response, IMHO. Never take them seriously.
As rather dramatically shown by the gavotted Gavster here, insipid
trolls hate that even more than being ignored.]

yes, that's right. The poor pathetic slob is so starved for attention that he just wants to goad me into a fight here. That or he's fanatical about "getting even" with me for the amount of damage I've done to him over the years in pointing out his many failings, misunderstandings, and just plain lying. Of course, couched in satire in pointing out the holes in his arguments and wild claims.

It certainly helps that I've caught him with his foot in his mouth many times, like the time he said that "if Steve Jobs ever comes back to Apple, he will destroy the company. He is an arrogant bonehead" (of course, when Steve DID come back, there was sinclap kissing Jobs' butt and praising him to the skies, and vigorously denying he ever said that).

There's another pro-Mac troll ranging through Usenet who's
> just about as dense, and here's what I think we should do about them.

you know, with all the toxic fumes that burning tires give off, I would imagine that's how the whole sad story started.

Of course, my theory is that sinclap is trapped inside the Steve Jobs

Reality-Distortion Field, and the lack of oxygen there is what's causing him to hallucinate and have bad thoughts about the imaginary "Atari jihads" who are "out to get him" and his Mac ..... :)

>
> [I'm making light of this guy, Daniel, but I earnestly hope _you_ don't

> As rather dramatically shown by the gavotted Gavster here, insipid
> trolls hate that even more than being ignored.]

believe me, I have never ever taken the little weinerhead seriously to let him ruin my day, despite his many attempts to "character-assassinate" me - he's his own worst enemy in that regard. sinclap's even gone as far as calling me a failure for my job (sales in a hardware store, for which I am paid rather nicely and actually enjoy, I love serving the public, and my bosses there appreciate my abilities) and for being the vice-president of TAF (which, when anyone else has found out, has commented that was pretty cool - that includes Shawn King from The Mac Show, when I met him at Macworld Expo last July in NYC). I and my friends in the Atari forums simply laugh at his obvious puffery and his bogus claims about his job and his "macho" accomplishments. Along with heaping helpings of the truth....

I, at least, can step away from the computer from time to time and enjoy other things in life - like reading, biking, a long walk, taking in an exhibit or a museum, or watching the Simpsons.

maybe that would be the basis for another one of your satires, Robert - "When Mac Users Go Bad :) "

It may excite you, but to me it sounded kinda cheesy.
I doubt the masses would care about a new Atari now after all these years...
and if they looked at the proposed specs they would care even less.

People want 700Mhz as a minimum these days, not some old '040 with a
1996-era graphics card.

IMO only ofcourse.

Regards,

Clockmeister.

Hi Chunks!

I do frequent the Mac forums. You are correct about the Wintel forums..

> sinclap's main angle of attack is calling all Atari users "jihads" and ridicules them for still using their legacy systems. He also claims to be an "Apple Power Rep", employed in some way to sell Macs, however his extreme stupidity and his lack of spelling skill belies the fact he'd have a hard time holding a janitorial position much less a position selling any sort of computer, and he absolutely refuses to give any proof of his employment.

You just attacked your jihad friends who are wurst spiller thin i am...
When lousing u attac thare spillieng...

> He's also a very poor debater - when he's shown up for the vast number of mistakes, gaffes and outright lies he's made, he immediately goes into personal attack mode, which includes attacks against personal appearance, obesity, sexual proclivity (he considers himself quite a "stud", forgetting to put in the "pi" in the middle) and working position. Indeed, what is most funny is his many tirades against Canada, which is where the majority of his most mortal "enemies" reside - he's suffered a lot of damage when he's done that.

u maiking this up or what? Did you not attck Jesse and Dubya the other day? Pot Kettle Black...

> Since he's been around doing the same sort of thing for the last eight years, Atari users consider him these days to be nothing more than someone to have sport with - they find it fun to poke this troll with sticks until he squeeks. And the number of Mac users who've run into sinclap are surprised that someone who claims on his side can be so dense - he's even gone as far as saying that all 68K Macs are junk and should go into landfills, he's claimed that Mac OS 8 was pre-emptive multitasking, etc. ......

8 years...Thats it...Watch for Mac X on March 24...

> In other words, he's pretty much proved himself to be a premier crank and a "kook". :)
>
> Maybe Mayor would like to debate sinclap? It wpould give Mayor a chance to debate someone his own age and IQ, and his own home state (sinclap hails from Indiana as well).

No, I hail from mn!

I was in the distortion field at last Jan MacWorld/SF at the keynote.
About 15-20 rows from the stage..

To bad Sam and Jack are out of the picture now...

Talk about character assasinations, you are the king at that.. The
last two to three posts have been filled with such character
assasination stuff.

So are you still the veep or is taf kaput?

>   I, at least, can step away from the computer from time to time and

Considering a G4 cost compared to a Hades, a small price indeed for a modern solution box..

Erp, were you asleep when the results of an independently-conducted recount revealed that Bush *won* Florida. It was just last week.

Not to say I'm thrilled, but just to clear up that point.

   actually it also prove sincrap's brain takin' dirt nap. sincrap also
lie as always - he claim dat al bore would win in landslide. just like
he say he no say he call jobs "arrogant bonehead" who'd "destroy crapple
if he ever come back".

   sincrap an' al bore  even match - both liars who' re big crybabys
when thing don't go dere way. oh, wait, me take back - at least bore
admit him big liar.

Thanks for posting that. I'd checked it out before & it does look pretty promising. I'm sticking with my PSX for now & waiting for the X Box & Indrema (if it make it out) & will probably decide between those two. I do hate Bill Gates, Windoze, Micro$oft & generaly all things IBMish but I gotta say, it sure looks like the X Box will be the next big system. I'd sure like to see the X Box & Indrema split the market. Nothing against Sony but I'd say after 6 years of Sony domination I wouldn't mind a little change.

   Later,
     JJH

Please let us know what they say..... I have done this sort of thing also. I have written many letters to software companies asking them why they did not make Atari versions of their programs. I admit, most said they would pass on Atari, but a few did come around...

Looks like a glorified PC? Personally I wouldn't bother. The fact that the Dreamcast has CE on it, means I won't buy it either. Who wants the hassle of potential hardware failings because it is based around substandard hardware? As far as I can see the best successor to the Jag is N64. Ahhhh Goldeneye.

Mark

Will be run off of Linux. Supposely you can download the development
software to develop games. You probably can call it an open source
console...

Gore was denied a recount. I would be pissed after all that
campaigning and lose to a tecnicality due to incompetence by the
elected officialis in the affected counties...

by the way you sound like Karmi Communist...

Nah its a open source PC, already got one. No custom trickery at all, how
boring. Now the Gamecube will have a PPC gecko chip in it, that's a console.

Ah, but they used the dodgy method of counting 'overvotes,' i.e., counting every vote for Gore AND Buchanan as a Gore vote, which was never going to happen in any of the recount scenarios the Gore team went for, and would never have been allowed. The previous count, where Bush won, included all hanging chads, dimples and even a mark anywhere near a candidate's name. This is considered the most liberal interpretation , with the exception of its exclusion of the overvotes.

Myself, I went for the only worthwhile candidate -- Ralph Nader. And I'll do it again.

--

Best;
Steve Duff   Team *AMIGA*

The ICD Multi I/O board (MIO) is a complex peripheral device which adds exceptional power to the Atari 800XL or 130XE computer. The MIO gives the user five additional hardware functions not available with a stock 8-bit Atari computer. These are: a parallel printer interface, a serial interface for printer or MODEM, a printer buffer, a bootable RAMDISK, and an SCSI/SASI interface for hard disk drives. An optional sixth function (80 column board) may be added at a later date. This 256k MIO was used to run an ATARI BBS quite a number of years ago and was working fine when it was stored, It includes the MIO base unit,Instruction manual, software,SCSI hard drive Seagate 1096N and SCSI cable. I couldn't find the power supply adapter. This needs an adapter to use on the 130XE.

SHIPPING IN USA ONLY. Payment must be received within 7 days of
auctions ending.
     Shipping charge USPS MAIL $10.00. PS:The ICD/FTe Multi I/O (MIO),
all versions, can use both AC and DC supplies. But stick to voltages
of at
     least 6.2-7.2 V. **AUCTION ENDS**

Must be attempt to increase new users to the web site to increase adv..rates...-)

> Why? Because of the fact that during its heyday the ST could, with the help of David Small's Magic Sac and Spectre plug-in modules and software, do a more than adequate job of emulating a Macintosh, and for less than what a real Mac cost at that time. :)

Yea..But who is still here? At the time, I was an Amigan...

> Check it out and see what you think - it's at http://lowendmac.com/clones/atari.html . Might not be a bad idea to contact Dan Knight, the owner/maintainer of the site, and give him some positive feedback as well as any suggestions to improve the info on the page.

Very underwhelming. At least the Atari historical web sites have graphics and pictures to show...

> One can't help but thinking that The iDiot Forever Known As Sinclap will need a change of underwear after taking a look at this site - especially as it defeats his one-man campaign to denigrate the ST, as well as all 68K Macs still being happily and productively used daily by their owners, as "junk". There's a lot of great links there on software, hardware, upgrades, etc, that'll keep those Macs running long into the next few decades. Will TiFKAS now start a disinformation campaign (complete with character assassination, long rambling diatribes against imaginary "jihads" who are "out to get him", and poor spelling) against LEM now and shoot more holes in the foot which isn't in his mouth ? :)

In your imagination...I am to busy with preparing for the roll out of X..

By the way you sound like KarmiCommunist....

Good grief, an unlikely web site has written up nice things about the ST!

Low End Mac, a well-known and respected source of information and daily news for Mac users of all stripes from the original 128K models to the current Cube and iMac models, has dedicated a page to the Atari ST and related models, giving specs and even some links to Atari resources like Hallvard's Quick FAQ.

Why? Because of the fact that during its heyday the ST could, with the help of David Small's Magic Sac and Spectre plug-in modules and software, do a more than adequate job of emulating a Macintosh, and for less than what a real Mac cost at that time. :)

Check it out and see what you think - it's at http://lowendmac.com/clones/atari.html . Might not be a bad idea to contact Dan Knight, the owner/maintainer of the site, and give him some positive feedback as well as any suggestions to improve the info on the page.

One can't help but thinking that The iDiot Forever Known As Sinclap will need a change of underwear after taking a look at this site - especially as it defeats his one-man campaign to denigrate the ST, as well as all 68K Macs still being happily and productively used daily by their owners, as "junk". There's a lot of great links there on software, hardware, upgrades, etc, that'll keep those Macs running long into the next few decades. Will TiFKAS now start a disinformation campaign (complete with character assassination, long rambling diatribes against imaginary "jihads" who are "out to get him", and poor spelling) against LEM now and shoot more holes in the foot which isn't in his mouth ? :)

PC sales have slowed to a crawl this holiday according to all the press accounts.. Customers are opting for digital devices this season and are taking a break from computer purchasing...

Also, according to comments by SJobs, Apple screwed up by not having a CRW device standard, confusion on who is the customer for the Cube etc. As a result, they have put the breaks on production to slim down inventories by Dec 30 in contrast to Compaq and HP who are continuing to stuff the channel. Can you say blood bath beginning Jan 1 for those two?

Not having clones, what ever that is not a factor with the changing market this time around.

Often you want the slution to one problem, not x problems.
And more often then not, you need the result of a previous calculation
to execute the next.
The world is not as simple as you may think.
Stephan

I stated that voting based on a candidates OS preference was dumb.

I get flamed by foreigner with penis envy. why?
not because he was responding to my point, but he was
somehow offended that "free world" was used in reference to
the US.

Should I take offence to "empire where sun never sets" being
 used in reference to England?
Should I be offended by the people from "the land of the rising sun?"
"land down under?"

We used to call it "New world","Land of the Free", or "free world"

I don't get how I'm suffering from penis envy or considered a foreigner
talking about an election in my own country that I voted in. I do,
however, feel someone's nose a little too close to my ass.

And quite a few even believe it was just that. That the meaning of "world"
is quite different from "country" should become clear even to you when
you think about the people from Monaco (look it up it the CIA world
[sic!] fact book) calling their country "the free world".

> I don't get how I'm suffering from penis envy or considered a foreigner

I don't think the USA had a penis to be envious of, although it has a
rather big asshole that a lot of "leaders" like to kiss. But be assured
that your own personal ass is not in danger at all, not from anybody's
nose here at least.

Matthias

You're the one trying to portray the world as simple.

Meanwhile we have multicpu Quake3, multicpu OpenGL, multicpu video decoders, shared nothing databases, shared nothing renderfarms, loosely coupled Beowulf clusters doing all sorts of interesting and mathemically interesting problems and operating systems that have been designed since decades before the Atari ST to maximize the potential of hardware by doing many diverse things at once.

I can provide concrete examples of my point of view. The opposing point of view can only come up with toy projects you might find in an Rudimentary Algorithms text.

--

Common Standards, Common Ownership.

The alternative only leads to destructive anti-capitalist
and anti-democratic monopolies.

Those are trivial since they are separate task part of one process.

Rememeber you said :

"Anything can be parallelizable if you program it right"

And thats wrong.

>
> I can provide concrete examples of my point of view. The

The point of view is 'Anything' can be done in parallel, and thats false.
Even at the instruction level, superscalar precessor dont alway acheive
full parallelism because of dependency.

The truth in this world is not everything can be parallelized because of
dependency.
If you cant grasp the concept of dependency, and think because quake
benefit from 2 process it prove your point. Lets end this here.

Stephan

     You are quibbling with pedantics versus practical engineering.

[deletia]

     The trivial example first cited was one in linear algebra.

     The counterexamples I provided are pretty much nothing but matrices.

--

     Also while the herd mentality is certainly there, I think the
     nature of software interfaces and how they tend to interfere
     with free choice is far more critical. It's not enough to merely
     have the "biggest fraternity", you also need a way to trap people
     in once they've made a bad initial decision.

Seems like the new Amiga will use a modern processor and sub systems unlike a certain cretin which went no were...

October 21, 2000, Melbourne, Australia - It is with great pleasure that we are able to announce the first new Amiga hardware in over 6 years. The AmigaOne, our first consumer product, will be targeted at the desktop and workstation market. Further products to follow will cover the markets from Personal Digital Assistants and upwards. All these products will run a single piece of software, the revolutionary Amiga Digital Environment (DE).

We completed the AmigaOne specification three months ago, and dubbed it the "Zico". It is a specification and not a product because Amiga is a software company, not a hardware manufacturer. The ability of the Amiga DE to host itself on multiple hardware and operating system platforms frees us from hardware dependency and gives our partners and our customers the freedom to chose the hardware that best suits their needs and tastes.

The Zico specification is as follows:

One AmigaDE friendly host processor (PPC, x86, Arm, SH4, MIPS)
64MB+ memory
Next Generation Matrox graphics card
Creative EMU10K1 based audio card
10 GB+ HD
CD/DVD
USB 1.0
Firewire
10/100 Mbps Ethernet
56k modem
Spare PCI slots for expandibility

With the completion of the specification stage of the Amiga One, we contacted several respected hardware companies with a view to selecting partners who would be interested in creating AmigaOne products.

The AmigaOne process involves close co-operation between Amiga and our partners' hardware groups, the running of the AmigaDE on the hardware, and a thorough quality certification of the final product. Only then can the product be called an AmigaOne.

Whilst still in detailed negotiation with several companies, we are delighted to announce the first partner company and its initial set of AmigaOne products.

The Eyetech Group Ltd, of Stokesley, U.K. already has an excellent reputation in the Amiga community. They have done much to keep the classic Amiga alive during the last five years, and we feel that in the creation of the first new Amiga machines and the transitioning >from the classic to the next wave, that experience will prove invaluable.

Bill McEwen President of Amiga Inc commented: "This arrangement builds on and extends our existing partnership agreement with Eyetech, first announced in April of this year. Our experience during this period has shown Eyetech to be a no-nonsense company capable of delivering what they promise on time and this consideration also weighed heavily in our choice of a hardware partner for the PPC based AmigaOne."

Alan Redhouse, Managing Director of UK-based Eyetech, said; "I am delighted that we have been able to build on our existing partnership with Amiga and continue our close working relationship with them on both a technical and manufacturing level. Our decade of Amiga experience, plus our hardware and software efforts to push the Amiga forwards means that we are able to work with Amiga to deliver a proven upgrade solution to Amiga users which gives their existing 'Classic' applications an immediate and substantial performance boost whilst providing full forward compatibility with the new Amiga DE. Our work on the Predator line of boards means that we can help Amiga to fulfill its requirement of maximising the investment of the current community as it moves forwards."

Fleecy Moss, Chief Technology Officer, Amiga Inc added: "After talks with the hardware development staff of several companies I am convinced that working with Eyetech will allow us to offer an elegant solution that gives both an excellent level of backward compatibility and a powerful basis for the new Amiga Digital Environment. Top of our requirements list was to ensure that those Amigans who have spent considerable money in staying with the Amiga would not be left out in the cold. Whilst you can't please all of the people all of the time, we think we have come up with a set of products and solutions that will put a smile on as many faces as possible."

Eyetech is focusing on an immediate need in the existing Amiga market. Many have already invested considerable resources in their classic Amigas, both in terms of hardware and in terms of software. Whilst keen to move forwards with the AmigaOne, they also want to maximise their investment in the classic platform.

The Eyetech AmigaOne PPC 1200 is a custom board which uses Eyetech Predator technology with the "zico" specification to provide a perfect synergy of classic and next generation. It provides all the functionality of the standalone AmigaOne PPC, but has been extended to mate with a classic Amiga A1200. This allows customers who have a serious investment in the classic Amiga to continue to use their machines whilst also having a brand new Amiga at their disposal.
The 68k processor in the A1200 will be emulated at a substantially increased level via the PPC processor on the AmigaOne, whilst the classic operating system can take advantage of the AmigaOne's next generation hardware resources.

The AmigaOne PPC 4000 machine is similarly designed to allow customers who have a significant investment in their classic Amiga A4000 to be able to move that investment forwards whilst also benefiting from the next generation capabilities of the AmigaOne.

The Eyetech AmigaOne PPC 1200 will be available as an upgrade for owners of towered A1200 computers, the Eyetech AmigaOne PPC 4000 as an upgrade for Amiga 4000 desktop computers in tower conversion cases. Options for producing AmigaOne PPC upgrade designs for other Classic Amiga designs (such as the A3000 and Amiga International A4000T) will be looked at (subject to demand) once the A1200 and A4000 products are released.

In order to implement all the features of the AmigaOne specification the, A1200 and A4000 upgrade versions will feature one AGP and six PCI slots, a user-upgradable G3/G4 (Macintosh-type) cpu slot, up to 512MB SDRAM and a high speed IDE/ATAPI interface. The system will be dual-bootable both into the Amiga DE and into Classic Amiga Workbench. This latter feature will allow purchasers to have the performance benefits of full G3/G4 cpu speeds and 512MB of SDRAM memory whilst running Classic Amiga software. Both these boards are scheduled to ship in 1Q01, with developer versions being available in December 2000.

Design of both the Eyetech AmigaOne PPC A1200 and A4000 products has been done with great sensitivity to the existing user and developer community.

"By releasing the classic compatible AmigaOne PPC products first," said Alan Redhouse. "We are providing a transitional path forwards for the existing community, enabling them to maximise their current investment whilst also leaping ahead with the new Amiga DE."

In order to facilitate this transition, the classic Amiga operating system will see its lifeline extended. OS3.9, to be launched before Christmas will add a raft of new features and functionality, and will be able to run on the Eyetech AmigaOne PPC classic products.

Eyetech are also keen to talk to existing hardware manufacturers about possibilities for licencing, manufacturer and other co-operation in order to ensure a smooth transition of the existing Amiga community from the present to the future.

Amiga is also very close to signing up partners for a standalone AmigaOne machine. The ATX form factor AmigaOne has been designed to run the full consumer version of the Amiga Digital Environment (DE) allowing the best of the Classic Amiga software which has been ported to run directly under the Amiga DE, and the use of a wide range of Amiga DE-based digital content - such as productivity software, content creation suites, development

environments and 3-D games
- to be used 'out of the box'.

All this work - including extensive testing of hardware and software components - is scheduled to be complete in time for end user deliveries 3Q01. Amiga Inc is currently in negotiation with several potential partner companies for the development and manufacture of the stand-alone AmigaOne and its related digital content/software. Companies interested in producing this version, utilising the PPC processor family include Eyetech, and bplan GmbH of Germany. We hope to have announcements to make on this within the next few weeks. Other companies and other processors are also under negotiation.

A new website is being set up, specifically to provide a focal point for news, questions, comment and discussion on the AmigaOne, and we encourage people to visit it and participate.

Minneapolis, Minnesota�December 29, 2000�sinclap today announced that being at MacWorld/San Francisco(January 9-13) is a done deal. sinclap will be attending the show for one day on Tuesday at the main keynote. The rest of the week will be in consulatations at a near by hotel.

sinclap ignited certain usenet newsgroups that were on the last legs with wisdom and thought. sinclap has many supporters and detractors worldwide.

Umm I could explain to you that multithreading is not parallel computing, and that the best example of parallel computing on Intel processors is MMX SIMD instructions, and for the PowerPC it's Altivec. Neither Intel or Motorola are responsible for these things, the ideas behind SIMD have existed since the 1960s. If you look at Fortran, you will notice a few things that suggest how long this stuff has been around, like vector restriction.

This stuff is known as vector computing, which is what super parallel computing is all about. Now surely you're right if you say that correcting a set of pixels for perspective correct texture mapping is highly parallelizable..
But Quake doesn't work just by transforming some pixels..
The matrix inversion thing is a valid dismissal of your statement that "anything is parallelizable if you program it right"
In a program that has to do matrix inversion at least once, there is one "thing" that is not going to be parrallelized!

Now, to prove me wrong, parallelize this:
An in-order walk of an arbitrary binary tree! :-)
This is a good example, because this is a major part of the Quake graphics pipeline, the walk of the BSP

If you don't have an answer, then I suggest you go home.

Oh yes.. when you break a process into threads, you're not parallelizing, as the OS/system is responsible for when/how your threads are called. Consider this a deterministic multithreaded app has to give the same result running on one processor as two, so clearly its not parallelization. In a parallel algorithm, the actual data or instructions are deterministically processed at the same time, as a part of the algorithm.. this is not the case with multithreading!
Multithreading/tasking has nothing to do with algorithmic parallelization!

Not sure about others, but I'm still digesting the excesses of the holiday period (groan!). That takes a LOT of siestas, sleep and sunbathing, which leaves little time for reading/sending news items...

Still, sinplop is either dead or on holiday (janitors DO get holidays I believe!)...so there are no posts worth debating right now...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. Just 1 thing, the Coldfire ATARI project! That SHOULD be worth a little bit of advocacy angst should it not?

My own opinion is that it will DIE! Those Medusa guys are trying to blackmail us into buying with their "...500 pre-orders or no go..." philosophy...do they actually have a machine to sell?

Hmmm - we had a bit of white Christmas (about 5cm of the fluffy stuff)
while yesterday they had a 50cm dump in Nova Scotia & New Brunswick -
but 40C --- nawww that's too hot for any human to actually enjoy !

Me ...... between -15 and +25C is tolerable - beyond that - excessive !

The Canadian Curmudgeon (in sunny, getting dusty, 0C, Calgary)

> you sunbathing, Nelson?

Nope, I'm skint at the mo' so I had to stay here in Christchurch for Xmas and New Years. Queenstown is neat, but its a mad-house at New Years, as the population triples on the 31st of December...

We had horrid rain and bitter cold wind on New Years so your folks probably did get white flurries being at that altitude. There was snow in Dunedin at sea-level a month back. I was there competing in a track&field meet. You normally wear a skimpy singlet and shorts, but I ran out of gear to compete in, short of piss-drinking clothes!

I've heard its kinda dry around Melbourne currently...fire risk stuff...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

You lucky devil...we had +7-8C, driving rain, and big wind chill here in Christchurch on New Years eve. Both Xmas eve and New Years eve were preceded by wicked electrical storms, hail, rain, etc...we'd also like to see the first sunrise of 2001 soon...its been cloudy for most of 'em!

40C would be a bit hot tho', funny how you can never reach that happy medium in life isn't it?!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

It's a bit cooler in Perth, WA at the moment... 36C with extreme humidity.
Aaaaaarrrgghhhh!
Sounds like Christchurch isn't such a bad place to be, I've grown to love
wet, stormy weather  ;-)
```

Yeah, clockmeister's 37 is nothing 39 here today and a TOTAL fire ban. I
hate summer. Long for the frost and rain. Besides my study get's too hot
(only bloody room in the house that isn't insulated besides the dunny).
Can't go hunting because every thing is sitting in the shade, there is
fishing I suppose..........

Mark

Oh, well we can't all be Vegans;-) The wheather dude's reported 43 for Melb
yesterday, but luckily we only got to 37. But as you  say the humidity
sucked.

Is anybody going to advocate anything today?
```

Mark

I think it is time we all took affirmative action. I vote we sit down and
have a discussion to resolve to advocate something immediately. Possibly
with beer and pizza......

sake of killing (other than introduced species or species in plague-like
proportions) is for yokels, hicks and other simple folk ;-)

The wheather dude's reported 43 for Melb

just for the record I spent most of my life living in the country. I hunt
vermin and food. Both I enjoy the same as fishing, and growing your own
food. Incedently I have found that most country people don't kill randomly,
but bored city folk do. I grew up hunting and fishing and do enjoy it. It is
the most relaxing thing I know of. I do get a little emotional about it, I
have been doing it since I was about 7 years old. Which is the best way to
learn respect for the enviroment. Incedently my Dad was in the New Zealand
wildlife service, I spent most of my time living on trout hatceries. Hunting
and fishing is a way of life for me, not an ethical issue.

Post # of 74714

Larry, Inventory
is actually pretty good and was pretty good on Dec. 31st. At the
wholesale level, it was less than 4 weeks including the two problem
children of
the Powerbook 400 and the Cube. And today, just those two units are
the only big problems in the lineup. Virtually everything else is below
3
weeks of wholesale inventory.

All of the iMacs have been restocked since the beginning of the year.
And using the sales rates since Jan 1, there still are less than 3
weeks in
stock. This is very good.

The comparative problem now is that the wholesaler has been out of
stock for so long, that the sell through rates are currently very low.
So
calculating "weeks supply" is both overstated and suspect. Once all
units are back in stock, then the calculations will be much more
reliable.
With the change in the product lineup, and lack of immediate stock to
sell, the sales will be shakey for a while. The question will be what
happens once everything is back in stock.

sinclap!

Yeah, but the Beef roast's don't deliberately roll over carve themselve's up
and then shrink wrap. What's the diff? Just some people don't like working
for their food. Most animal's would hunt you given half a chance, after all
you are only human:-)

Ok, granted - that might be the case in NZ where as far as I can tell the
environment is something of a issue that is taken fairly seriously. In West
OZ, there is a saying that the farmers have a mentality of "if it's alive,
kill it". That, in my experience with the farmers that I know seems to be
pretty accurate unfortunately.

My brother in laws girlfriend's family take great pleasure in sharing their
"hunting" mishaps - which consists of things like rabbits and kangaroos
having various parts shot off and other acts of cruelty (like the ones that
get away in such a state because they can't bring themselves to actually
kill the animal after they've injured it). I don't see the humour in that
sort of thing, in fact it pisses me off - a lot.

Catching more fish then people intend to eat, only to throw away the excess
is also something that pisses me off. I see that all the time, such a waste.

I could go on and on, but I think you get my point.

 I grew up hunting and fishing and do enjoy it. It is
>the most relaxing thing I know of. I do get a little emotional about it, I

Hunting
>and fishing is a way of life for me, not an ethical issue.

It sounds like you are a responsible type, not the kind I'm used to
unfortunately.
We're obviously seeing things in different perspectives and under different
circumstances, but I understand and respect your point of view.

Never judge a book by it's cover, and never underestimate people. And most of all never associate Conservation with preservation. Australia's wildlife need's looking after too. I think you will find it in more danger than NZ's. Australia has the highest rate of urbanisation in the World. More than 80% of the population live in major eastern seaboard city's. And to top it off, I still cant find anyone in Australia with a nice cheap Jaguar to sell. I think we can safely say that, yes we do have a very different perspective's, and that I understand how you feel. But don't assume that a hunter (or fisherman) is not a conservationist. After all if there are no deer or bunnies left, there is nothing to hunt :-(. Nuff Said.

Regards

Mark

Thing's have gone quiet, What has happened to sinclap and Razor? Is the Mac
selleng by the miilion's? Will the Millan 3 show it's face? And more
importantly, what is happening with the Hades PPC project?

I suspect Milan and Hades are just more vapourware - as to the other -
we can only hope they have gone into the 6th dimension !

The Canadian Curmudgeon (in sunny, snow free, Calgary)
Canada - where ignorance prevails, tyranny persists

For real eco-freaks the only way to stop the degradation of the eco
system is to remove the human race - so says Canada's David Suzuki the
numero uno eco freak on the planet

That's preservation, as opposed to conservation, which is pretty much on the ball tho. We are after all a nasty species. As far as I can see the best way to go is to try and sustain or improve the wildlife so my children will be given the opportunity to do and see what I have been fortunate to see. Unfortunately greenies (yes a generalisation, I know), have a tendencies to grab media attention. Sometimes it is necessary to correct the imbalance of nature man has created, hey we are caretaker's I guess..

Mark

PS , pretty much covers it too.

After all if there are no deer or
>bunnies left, there is nothing to hunt :-(. Nuff Said.

Eradicating introduced pests like foxes and rabbits would certainly help preserve native species which have been seriously affected by these introduced species. I, for one would be happy to see them all gone as long as it's done in a humane fashion.

I'll leave it at that, this is after all not even remotely on topic,
although it did generate some discussion in an otherwise dead newsgroup ;-)

Regards,

Clockmeister.

What he said, as near as I can recall, was that the answer to the world's ecological problems would be the removal of the human species - which is, of course quite accurate - if you ignore volcanoes and such ! In any case, I am quite sure this left lib looney has written similar crap in some of his lately published inane drivel !

hi i'm looking for the rom image of the lynx to be able to play it on the
(mac) emulator but i'm not able to find it anywhere on the web. can anyone
help me out?
if you have it you can send it to me by email (mrtnglas@dds.nl).
i also own a lynx handheld so legally it should be alright....

well tanhx anyway.

see the pro-Mac:

http://www.maccentral.com/news/0101/19.apple.shtml

iMac sales in Oct.-Dec. 2000 fell to 308,000, down from 702,000 in the same period a year ago and 571,000 in the July-Sep. 2000 quarter. That's not a drop, that's going over a cliff. In fact, while the article lacks complete data, full year CY 2000 iMac sales must have fallen well short of full year CY 1999.

Sorry guys and gals, but the iMac boom is over. Better go out and find some REALLY cute new colors! Quick!

And the Cube? 107,000 sold in the launch quarter, then a paltry 29,000 in Oct.-Dec. This puppy will get dropped. It's worth about $799, and Apple probably can't even make it for that cost. If you read the whole article the average revenue yield of a Cube was only $482 last quarter, down from $1542 the quarter of launch. How can this be? Rebates plus some outright give-aways? Maybe, but as likely is that there is something strange in the Cube's $sales numbers obtained by maccentral

All in all the article paints the current situation at Apple more frankly than any I've seen on a pro-Mac site. If Apple's fans are willing to say this, might the situation be even more desperate? Will their fabled $4,000,000,000 in hoarded cash extracted from loyal, but

incredibly naive, customers bring them through this crisis? Tune in
next week for the next episode of the Crash in Cupertino!

Tom Elam

In comp.sys.atari.advocacy mark <mdwh2@nospam.cheerful.com> wrote:
: On Sun, 12 Nov 2000 03:52:03 GMT, "**** ****" wrote:

:>   No, the worst part is the current owners, and that it looks like
:> they may just release an Amiga-branded machine/software. However,
:> the brand will be the only thing left of the amiga.
:>   Their OS will be ditched, and you should hear some of the lame
:> arguments that I do, in defense of this move. "Oh, it would take so
:> much to update it,

: And Apple are ditching their OS to move to a new BSD-based OS. And
: somtime Microsoft may get round to finally ditching their Windows 9x OS
: in favour of NT/2k.

Oh, come on. Apple had insurmountible flaws in their OS. And Windows still
hass a lot of stupid legacy. The AmigaOS may have some faults (we always
say VM, MP), but there is not a single bond between the "new AmigaOS" and
AmigaOS 3.x. No more than there is one between AmigaOS and a Windows
machine running UAE.

:>   Their hardware platform will be completely ditched. This is more
:> justifiable. The 68k is end of life, of course. They'll farm it out
:> to a 3rd party (this may be the one wise thing that they do). There
:> can be no arguments with these statements, from me or the more rabid
:> "anti-Pseudamiga" crowd. However, there is more to the new hardware
:> than just this. I personally feel that the new hardware lacks
:> several necessary criteria for it to qualify as next generation
:> amiga hardware. Further, the new hardware will be incapable of
:> running AmigaOS 3.5. Backward compatibility shouldn't be absolute,
:> but in this case its warranted to show continuity.

: I agree here.. though they have said that there will be some sort of
: compatibility. For me, some level of compatibility is what I'd
: distinguish something between being 'a new Amiga' and 'an new machine
: with some Amigalike features at best' (Win2K can still run DOS stuff,
: Mac OS X can run older apps under some sort of emulation).

I don' care much about the hardware. Certainly, I've some investments in
my A4000, but clinging to it when I could actually run it on mostly
superior hardware would just be utter stupidity. If AROS were finished,
and had sufficient software support, I'd dig up some machine to install it
onto in a flash.

:> Certainly the new
:> "OS" won't run on the old hardware.

: It will be able to. You'll need an upgrade - but then the same is true
: if you want to run the latest Windows or MacOS on old hardware.

We're missing the point that there is no new AmigaOS. It's a userspace
program, much like Windows 3.

:> Also, while the new hardware can
:> hardly ignore PCI, there is not a single legacy Zorro slot, even
:> though many amiga enthusiasts have paid dearly of amiga expansion
:> cards.

: I presume that far more Amigas were sold with no Zorro slots than those
: sold with.

True. And most Zorro cards won't have much to offer.

: The Amiga isn't alone; ISA is being phased out of PCs, Macs no longer
: have Nubus slots. Did the A1200 stop being an Amiga because it couldn't
: used Amiga (A500) hardware?

Some fanatics would claim so. =)

:> And don't get me wrong, it's not entirely a practical want,
:> either. It would show that this isn't some generic pc box running a
:> funky os, but rather a new model in an older family of computer.

: Is a Mac just a generic PC box because they went from Nubus to PCI?

No, because it has its own positively unique architecture.
PCI is not processor or architecture dependent.

:> Think of it like this. Grandpa dies. Everyone is sad that he is
:> dead. Some sheister offers to ressurect grandpa, wouldn't that be a
:> wonderous miracle! Instead, grandpa is a zombie, going around eating
:> the grandchildren. Maybe it's not so great he is back, if it's like
:> this. This doesn't mean you wouldn't want him back, if it could be a
:> true ressurection though. This a good metaphor for the amiga
:> situation.

: Except that if you prefer the "old Amiga", there's nothing stopping you
: using a 68k AGA machine - they haven't died in the same sense Grandpa
: did.

Amen. Of course, I'd rather not use an AGA machine.

:> The atari, despite all the minor embarrasments that every platform
:> suffers, has been spared this indignity. Consider yourself lucky.

: All platforms that have advanced have also changed in many of the ways
: you describe. I wouldn't call staying with 68k forever (Atari or Amiga)
: being spared an indignity.

I'd rather not stay with 68k forever (move on WarpOS!), but the "new
AmigaOS" is no alternative. No more than MacOS.

In comp.sys.atari.advocacy **** **** <***@***.com> wrote:
: mark wrote in message <8351120326301236.NC-

:>Is a Mac just a generic PC box because they went from Nubus to PCI?

: Hmm. No. But that's not exactly fair. Imagine that Apple had done things
: differently, and that they ditched Nubus, the 68k, and the MacOS 1.x-9x
: codebase all at once. If they had, I would have trouble calling it yet
: another macintosh, instead, I'd be forced to think of it as the 3rd platform
: Apple had created.

Just like the Lisa.

: That they did all those in phases, says to me that even the lowly Mac 128k
: is a macintosh, along with the g4 cube.

After all, the G3 cube will run well-behaved 128k software, and it will
look like any other software.

: Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5
: codebase all simultaneously... not even a single transition amiga model.

There will be a transition Amiga model. And a big kludge at that.

: What's more, OSX still has some backward compatibility to the MacOS classic
: stuff. AmigaDE... hell, I don't even know how to describe it without spewing

: that sickening hype and PR crap. They are more interested in their
: ill-concieved "let's redefine computing and OS's" bullshit, than they are in
: building a "new amiga". If Apple were to have built that hypothetical 3rd
: platform, it would still be a computer, albeit a new platform. Pseudamiga
: isn't even doing that... with their MAME of operating systems.

Exactly. They say they wish to capture the "spirit" of the Amiga. I doubt
that it will be caught. Has anyone managed to do that as of yet? What is
this spirit, anyway?

: There are certainly 2 ways to look at this. One, Apple had plenty of
: uninterrupted time, in which to space things out, and do each single thing
: at a time. Amiga, however, has been pretty turbulent, and if they are to
: "survive" it will be necessary to jump ahead, and do all of these things at
: once. This is what others will claim, and I'll save them the trouble by
: stating it for them... but it just isn't true.

They could just look into WarpOS or AROS. Certainly, WarpOS is
PPC-centric, but PowerPC has never hurt somebody.

: Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip
: stacks, etc... are all integrated into win2000 or OSX. With amiga, if they
: exist at all (and I'm not talking just protocol stacks) they are 3rd party
: add-ons. This could be a problem. Then, you have a file system that can't
: come close to handling the 50+ gig hard drives that are now popular and
: cheap. 3d framework, ala openGL or direct3d? Not there. I can see that this
: will take alot of work. I am not blind. But rather than write the next
: version, they are ditching it!! If you have an incomplete project, that is
: 90% unfinished... that's alot of work, but do you abandon it, and start a
: new one, that by definition will have even more to do (90% vs. 100%) ???

Err, please try to look into things before you start spouting complete
rubbish, ****.
AmigaOS 3.5 has got a stack. 3.9 will have the very competent Genesis.
The filesystem has been updated since aeons ago to handle hard drives in
the terabyte class. I run a 20 GB one on mine, and I intend to get another
drive, too.
3D framework is there in the form of Warp3D, which AFAIK is an OpenGL
implementation.
90% vs 100% is not a lot, but I dare say that the AmigaOS is 90% complete,
as opposed to 90% incomplete.

: Besides, the amiga gui shell is still pleasing, and capable. There are parts
: of the api that are worth keeping. And even if it isn't, then write us
: another OS! I would think it unwise, but I can see why some would want to do
: that. But they aren't. AmigaDE is an attempt to redefine the OS. They don't
: want to write a true OS, because getting into an OS war vs. Microsoft on the
: low end, and UNIX on the high end, is a war that no one can possibly win. We
: don't need the OS "redefined" though, even if such a thing can help M$ in an
: anti-trust case (the browser is the OS, haha). And they don't need to fight
: this war. Cater to the amiga enthusiasts, and the people who like to try
: something different. And this does't even take into account the lack of a
: Zorro slot. What's the cost of this? $1 for the connector, $5 for the board

: space, and maybe a $2 pld?

There is no point in Zorro on a new architecture, and it certainly would be more costly to add than just some "bucks".

: I've came to the conclusion that it isn't that it's too costly or difficult
: to show some continuity, but rather that for whatever reason, they want
: none. Maybe they're embarrased by it, or the things that made Amiga "amiga"
: just don't fit their engineering philosphy. O maybe, they just needed a
: name, and were too lame to make one for themselves.

Basically, what we ended up with when Gateway bought the Amiga was a motely crew of disgruntled Silicon Valley engineers, each with their own agenda to revolutionise the computer world. Then they were given a cute little machine, whose name and user base they would take as a platform for their new, revolutionary system. They've never been Amiga users before, and have very littlke actual understanding for the actual Amiga spirit, which they claim to further.

     Very few things are really that strictly serial. Even those
     sorts of things can be sub-divided. Infact, those of us with
     an actual clue are aware that "divide and conquer" is the
     first maxim of computer science.

     TPC/C is a great example of this.

I am. That's why I realize that artificially deflating prices
by expecting Macintosh users to futz with their hardware
internals is quite absurd.

What makes you think the process will be constrained to only
inverting one matrix at a time? You both are thinking far too
crudely. Get out into the world every so often.

Sure, and Kennedy was assassinated by the CIA, and nobody ever walked
on the moon...

Two days ago I ordered 10 pieces of paper money from 10 different countries from a
company called Perth Numismatics. Lo and behold they arrived today and they are
very nice and colourful. They even have a bill from Antarctica. I didn't even know
they existed. These are perfect for stocking stuffers or people who are hard to
buy for. The website address is www.perthmoney.com
Good luck and Merry Christmas

Sheesh....I leave for a while and this group is dead....What gives? Even
comp.sys.apple2 is hopping active

Maybe this will jump start the jihads....

Hmmm...Maybe Chunks will find away to descredit the Toronto Star...

OK I know if I search for years in FAQ files I might find what I am looking for but perhaps one of you fine fellows can help me out quick. I have a quite a few Atari machines around. Mega4, ST, hell even some 400 and 800's. My question is what software is there out now that will allow me to use my ST or Mega4 to surf the web as easy as I can on my shitty PC with Netscape? I use my Mega4 for lots of crap and I hate my pc but that's what I'm on-line with now. Someone tell me what I need so I can kiss the PC goodbye. Then again, is there even anything out there that makes this dream possible. Please help. Oh and while I'm thinking of it, is there anything that can link my Palm 3x to my Mega4? I'll toss my pc in the can if this can happen.

Hi, JPK,

You're in the wrong NG for such a question. Try:

comp.sys.atari.st

or

comp.sys.atari.st.tech

The basic answer to your question is CAB1.5 as the browser and STIK/STING/DIALER as the ISP interface, for the freeware route, but limited as to speed and CAB2.8 and ICONNECT from ASH for the commercial route. I use CAB2.8 with STING/DIALER on a Falcon and Milan and on the former it's bearable, with images shut off and with the Milan as good as a low end Pentium. With the MegaST4, I found accessing the Net JUST about bearable re speed. You will also need to drive your serial ports at at least 14,400 and will need HSModem for this.

But you will learn much more from the guys on the above NGs

Bob King.

   is razor again!

   razor find interesting article dat put paid ta sincrap's lies dat
dere is no crapple inventory clog. dis article prove dere is - 11 weeks
worth. dis also prove sincrap talk out his ass 'bout him bein big shot
crapple salesman!

The term "Democrat" in the 1950's is not the same as it is today... in 1950
the average Democrat is roughly
equivelant to todays moderate-republican. Both parties have shifted to the
left an order of magnatude.

If you told a registered Democrat in 1950 that you were in favor of national
health care and free condoms, he would
call you a communist, however, this is how Clinton was elected.

This thread is rediculous, who the hell votes for the president of the free
world based on his
opinion of a PC operating system? Yikes!

Why is it so important to break MS up? So what if windows sucks, dont use
it. Its NOT MS's fault that
every other competitor refuses to compete. Hell, I was rooting for Amiga,
OS/2 and Mac, but each killed
themselves. Amiga was GREAT, but Commodore was a toy manufacturer, and MS
had nothing to
do with why Amiga failed (in fact, MS *HELPED* Amiga, I started out by
learning AmigaBasic, a MS
product). Mac, well, Mac is Mac, and OS/2, its almost like IBM *wanted* OS/2
to fail, and they continue to
try to drop support for OS/2 despite customers who BEG them to keep it
alive.
I want to see an OS suceed because its BETTER, not because the government
killed MS. MS can be beaten,
if a company makes at least a half-assed attempt. Adobe makes ALOT of
software even MS is afraid to go
head-to-head with, then theres AOL, Linux ect...
Even BeOS isn't really competing with them, by choice. Their main product
is BeIA, BeOS is a sideline, and
the free version requires windows. Every heading on Beos's site lists BeIA
first, then "we also offer BeOS..."

Its the "in" thing to hate microsoft, but people go home to Windows PC's
every day, when they can run anything
they want to. I like linux, and BeOS, but I use Windows 90% of the time, its
what I use at work also, I'm a PC
technician. MS will probably continue to dominate the desktop market untill
a developer actually markets an OS,
not just has one available.

Microsofts success is based on the fact they were there when the time was
right.Hell, if I were Bill Gates, and
had his money, I'd say fuck this, no more windows. I'm retiring, and getting

out of the OS business, but I wont sell
windows to anyone, I'll just let it die. Have fun guys!

I'm not pro-microsoft, I'm pro IwishsomeonewouldhavetheballstomarkettheirOS.
If their were an AmigaOS that ran
on PC hardware, and supported hardware within 3 months of its release,and
had a single user mode, I'd gladly
pay for it, I'd pay $500 for it. I don't really care if its $free or not, or
if its GNU-free/open source...Just support it,
release it often (don't let it stagnate like OS/2), make available developer
tools, make it your MAIN business, rather
than a sideline, and I'll run it as my main OS instead of just "playing"
with it.

Cmon BeOS, give me the choice of Multi-user, commision Loki to port games,
flood my ass with software and drivers,
and charge me $500. (and make www.beos.com lead to a BeOS page, not a BeIA
page)

David Ogg a �crit :
> Why is it so important to break MS up? So what if windows sucks, dont use
> it. Its NOT MS's fault that
> every other competitor refuses to compete. Hell, I was rooting for Amiga...

Your're right, but MS have a market way...very hard !
can you buy any PC in any store whithout window ?
no one can, because you havn't any choice, you must buy your PC
with window, and that's all !

Too, it's very dangerous that the same compagny, sells,
OS, applications and development tools...You cannot choice
easily, because if you don't use VC++..you will have some
problems...in this way, spliting MS (no destroy them !), could be
simply more efficent for micro market. I use NT at work,
but i use Borland...and I can say, that it's not always
easy everydays, because MS doesn't permit you to use other
tools easily (.LIB problems, DirectX, etc...)

but it's just my opinion !

"President of the free world"?! If 100M+ dumbasses thinking they were the
center of the world (and even worse, acting like it) wasn't such a sad
issue I'd ROTFL for a while :-(

Matthias

By "free world" I mean the US, How come no one bitches when Austrailia
calles themselves "down under" or when
england calls themselves the "empire where the sun never sets" (or
something). We could call ourselves the "new world"
like back in the day, but we're not so new anymore. Aw hell, I never noticed
untill I got on usenet that foreigners
have such nationalistic penis envy.

I would like to apologize to the Americans for starting this useless
subthread. I think your democracy is great and even if most Americans
voted Gore I too conclude that Bush Jr.is going to make a fine dictator.
--
Dennis SCP
My grandma knows that the first listed candidate has the first
punchhole, why doesn't your grandma know that the second listed
candidate has the third punchhole?

It is true that we (USAns) killed more USAns than the iraqi's did. Is this a bad thing? Before you go pointing your finger and saying how inefficient we were, look to the statistics in your own military. Of course they might not like to fess up to how many of their own they accidentally killed. Most militaries have difficulties explaining to their countrymen that it wasn't the enemy that killed their sons.

The politics behind the Gulf war are a little murky. I don't want to figure out the rational for it. A bunch of countries helped out on the "allied" side. I figure most of those governments wanted to be there.

For all the pride we seem to have in our country, most of us still trace our lineage to other countries. Whether it be Italian, French, German, English, Dutch, African, Mexican, Spanish,... we all seem to know our heritage. (My family tells me I am 1/4 German, 1/8 Scotch {since scots and english are very different}, the rest is a murky mix of the glowing melting pot that is the populace of the United States.)

Socialism does not preclude freedom. Freedom is a concept separate from political theory. There are many people deep inside Tyrranical dictatorships than the average Citizen of the United States. We in the US believe we are free, but fail to understand the responsibility that goes with Freedom.

Despite the fancy window dressing the US is nothing more than a corporate dictatorship.

Too little too late. The VC whipped your asses too if I'm not mistaken. Add to that the fact that YOUR MILITARY killed more allied troops than Iraqis did during the Gulf 'war' in so called 'friendly' fire incidents.

Not that you're reading this at all. You're probably jumping around the room waving a flag, shouting U-S-A! U-S-A!

Oh, and it's 'centre', not 'center'.
:-)

"We"? How many wars did you fight?
And no, you didn't.

Well, yes we are, but there are a lot of democratic principles in use. Since the poster spelled it with a lower case 'd', I'd assume this is what was referred to instead of the nation itself.

Might I be so bold as to ask - just what in blazes this has to do with
Mac, Linux, Be, Amiga or Atari computing engines - maybe it should be
posted to "alt.nutcases" !!!!

Just go away and take your trolls with you !

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY Guarenteed

READING THIS MESSAGE WILL CHANGE UR LIFE FOREVER

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing

: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1)Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #2)Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #3)Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #4)David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #5)Kevin Kniceley
: 4029 Minard Rd. N.W.
: Dover, OH 44622

```
: #6)John Decowski
: 51 Walnut Hill Rd
: Derry, NH  03038

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
```

: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5

: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

The two are mutually exclusive. Anarchy is the absence of government.
(*) Socialism requires a strong government which redistributes most of
the wealth of its citizens and controls key industries by threat of force.

Most governments, including that of the United States, are at least mildly
socialistic, primarily because those in positions of power love the fact
that it gives them greater power to exercise. There are no demonstrated
advantages of the system outside of this.

(*) One would expect that a true anarchy would also result in the
redistribution of wealth by force on a massive scale, but unlike socialism
it wouldn't be the government doing so.

"[s]o long as Socialism was understood in its wide, generic, and true
sense - as an effort to abolish the exploitation of Labour by Capital -
the Anarchists were marching hand-in-hands with the Socialists of that
time." [P.Kropotkin, "Modern Science and Anarchism"]
(from the Anarchist FAQ at
http://www.geocities.com/CapitolHill/1931/secA1.html#seca13)
That some authoritarian governments cho[o]se tho call themselves
"socialist" says little about the relation between anarchism and socialist
ideas.

regards
Matthias

heheheheh - crapple lose 660 million in 2 months!

hehehehehe - crapple end year on $225 million dollar loss!

hardehardehar - crapple have 11 week inventory dey can't dump even durin' holiday season!

fnarfnarfnar - even motley fool dump crapple as "must-buy"!

ladedadedah - crapple do better in canada den US, but somehow dere marketshare still shrink.

ROFLMAO - sincrap made out ta be even biger idiot den ever. even bigger idiot den when he claim algore crush dubya - it dubya do da crushin', algore act like sincrap, a whiny lil' baby!

even worse fer sincrap - canada economy pass us economy, us run outta steam. canada re-elect cretin as pm, dey crush udder parties. tubby black forced ta sell 50% of da pest cause he lose money - probably 'cos he followed imac selling model! hahahahahahahahahahaha!

sincrap probly respond wit' dodge response. sincrap my lil' puppet, i pull da dickhead's strings.

apple needs atari, and amiga ppc clones to overcome this, they cannot do
it by themselves they are losing the war, even if computers sales are
slowing for the pc, that does not mean they will buy a apple.
 in a slow economy people are very shrewd with there money, and they do
not like to think that they will be stuck with something that does not
recieve support, so if you want lots of new innovative software, just
say atari/amiga to the rescue!
thanks,
lance

dat not point - point bein' sincrap make big noise 'bout amiga when
he have no leg ta stand on. Current amiga he brag 'bout vapor, an' when
challenged ta show where ta find amiga fer sale, he mention computers
dat are gatherin' dust an' by his own admission use processor he call
junk. sincrap try ta wiggle out of hole he create, he just sink further
in it like hippo caught in molasses. if sincrap call milan junk, he have
ta admit same amiga he claim fer sale junk as well. if sincrap call
milan ii vapor, he have ta call new amiga vapor as well - just like
cheap crapple cube an' faster den 500mHz G4 dat jobs promise.

The current

   sincrap try ta make issue out of dan's choice becuase he run outta
argument after dan beat crap outta him in debate - sincrap even threaten
dan ta shut up by claimin' he put tagether web site claimin' he some
sorta wacko cause he don' belive in treatin' women like doormat. dat how
sincrap work, he try ta play dodgeball when he lose debate by changin'
subject - just like dubya, who sincrap sound more an' more like evryday.
sincrap caught lyin' just like dubya lie 'bout drunk drivin' charge.
sincrap afraid of his own sex, dat he may like men, dat why sincrap brag
he big stud an' he make fun o' dan's choice, call him homo.
>

They don't exist. 2 500 MHz CPUs do not equal 1 1000 MHz CPU, even if applications are designed to use both of them. Some applications can do just as well on two 500 MHz CPUs as they would on a single 1000 MHz CPU, others will suffer from multiprocessing inefficiences (performance lost either to thread synchronization or memory bus contention).

You are also wrong about the cost. The price of the standard dual-500 G4 configuration (256MB RAM, 40GB HD, DVD-RAM) is $3500. If you use the Apple Store build-to-order options to strip the machine down to the minimum configuration (64MB RAM, 20GB HD, DVD), it's $2500. (This is worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB HD and 256MB of 222 PC100 RAM, and most people don't need the DVD-RAM.) Nowhere close to $5000 in either case.

why is it soooo difficult ta sell Cube? could it be too much money,
too little expand?

>
> >   current milan have '060 option available. ya can buy milan wit' 060,

ah, tryin' ta make us laugh again, sincrap? dis ain't 1998 anymore,
an' now it pentium an' amd doin' crushin'. puny g4 can' even get past
500 MHz, an' even macaddict admit amd crush g4 at everything 'cept one
function in photoshop. 'sides, we all kno jobs cook da test by usin
bytemark set ta 486 - when bytemark adjust, imac get creamed by even
puny seleron.

where is proof sincrap? dis from say guy who claim 90% of atari app
die on milan even before milan release.

razor say sincrap head 100% bone.

try aroun' $500 fer motherboard. atari user smart enuf ta shop 'round fer extra off-shelf component, bring it way down below $1000. don't need plane ticket ta buy milan, just phone an' credit card. sincrap pull numbers out his bum again, dat why dey smell.

>
> >   so, why crapple no get deal wit' company dat matter - like staples

Strip a machine that you'll need to run MacOS X down to a
mere 64M? Do you even actually follow Apple's technology
in even the most superficial manner?

>worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB
>HD and 256MB of 222 PC100 RAM, and most people don't need the DVD-RAM.)
>Nowhere close to $5000 in either case.

```
     ...at which point you're pretty much acting as your own VAR
     PC style again. That somewhat undermines the whole point of
     even bothering with a macintosh.

     Besides, even in that configuration Apple comes out 2.5-3.5

     times more expensive. This is the same condition that Apple
     suffered from before.

     Except now Intel based systems are actually on par or better
     than the ~4x more expensive Apple systems.

     These days, an Apple is pretty much an expensive PC with a PPC in it.

That was precisely the point I made.  Not all applications are parallel
enough.  You can't equate 1GHZ with 2x500MHz because the two aren't equal
-- there are and always will be fundamental and important differences.
How important depends on what your favorite applications are...

>>applications are designed to use both of them.  Some applications can do

Sun gets lots of mileage out of multiple processors mainly because they
sell a lot of servers, where the workload is quite parallelizable.

You're deliberately trying to change the topic, in a most superficial
manner.  The point was that Apple's machines don't cost $5K any more.

>>worth doing since $300 to $400 will pay for a very nice 7200 RPM IBM 40 GB

Don't try to troll me into an advocacy fight.  I don't care what you want
to think about the value per dollar of Apple systems.  You were simply
wrong about the absolute dollar amount, by quite a bit.

However, that's the only way you can manage to get a Mac
system with specmarks comparable to cheaper Athlon or
P3 based systems.

>-- there are and always will be fundamental and important differences.

Anything can be parallelizable if you program it right.

This is rather the whole point behind BeOS.

If the bottleneck in your system is the end user, you
might as well just use an Atari ST and save your pennies.

No, you are trying to gloss over the fact that there is indeed
a macintosh at the Apple online store that has a price tag of
$7500.

>to think about the value per dollar of Apple systems.  You were simply
>wrong about the absolute dollar amount, by quite a bit.

     No I wasn't. The prices I quoted were directly from apple.com.

     However, there is a considerable ease of use issue involved with
     macs. If you decide to castrate the system and then install your
     own aftermarket parts, you are NEGATING the primary selling point
     of a Macintosh.

     It would be less absurd if you could actually get CompUSA to do
     all the dirty work for you in this sort of situation (like you
     could do for a WinTel PC). However, you cannot.

     Then there's the whole issue of $5000 being a poor benchmark in
     an 20000 AD where brand name PC's have also come down price. Apple
     may have finally managed to move no but the rest of the world
     wasn't stood still either.

Sounds like retail oversaturation. These chains do not carry much
selection in computer hardware and are usually last to get the
latest...Very good selection on office supplies which they concentrate
on..

> >
> > Jobs admits that Apple has a hit speed bump in education and with the

If so, should be well stock for the day after ThanksGiving, the busiest
day of the holiday season..

> >
> > Refurbs or used?
>
>   bran' spankin' new.

The site does not list the number ofnew ones in stock but old used
ones...Also, the iMac 350 is on backorder...Next!

> > Have you been on fool.com?
>
>   have ya been ta meryl lynch? dey be aroun' long time. fool jus'
> buncha idiot, dat why dey recommend crapple.

Yea...they miss the internet revolution and are too snobish to cater to
the small investors...CScwab kicked their ass!

>   many guy who saw post on mac.advocacy - dan tell me he cross-post yer
> article ta dem. many say ya idiot, ya liar, an' if ya did work fer
> crapple company ya'd be tosse don ear.

I don't work for them...

> > >   my employment no issue here - sincrap, who idiot who no nothin',

heheheh - sincrap deny many thing. sincrap deny dat he said jobs destroy crapple if he come back. den he try ta wiggle out when dan come back with proof sincrap did. we know when sincrap put foot in mouth, he deny everyt'ing.

sincrap make ton o' mistake - him claim ati card crap, den is reminded dat what in new mac. sincrap claim g4 cubes have been out fer over a year. many people here caught yer mistake 'bout claimin' adobe had midi app.

>

yeah i did - ya claim milan cost $2000, I refute dat. perfectly normal.

Eh butthead...

no, me beavis. sincrap always be butt-head...

A brand spanking new DV
> with software bundle is a whopping $999 plus tax...

an' no one buyin' despite sincrap braggin'.

> > > Do they matter?

heheheh - obviously sincrap once again shootin' off mouth witout
checkin' out facts. me go ta business depot, dey have latest in HP,
e-machine, ibm - canon, epson. plenty a' peripheral. even sell visor
(razor next purchase). jus' don' sell imac or imac software...
>
> > >

ah, but no one buy imac or other crapple product now, why dey wait
till after thankgivin' ? are crapple gonna drop price?
>

not old used one - sincrap jus' take cursory look. also sincrap
should try mac-pro.com, dey still have new g3 b&w in stock.
>
> > > Have you been on fool.com?

   nah, meryl lynch kick sincrap's bum. meryl lynch around long time,
dey no fool.

>
> >   many guy who saw post on mac.advocacy - dan tell me he cross-post

>
> I don't work for them...

   dey said fer any crapple-relate company. me talk with real crapple
power rep recently, said ya fulla crap. ya can reveals who employs ya.
also said dat if yer employer new what yer doin' here, he turf yas as he
no want law suit.

> >
> >   sincrap chickenshit. big fat liar chickenshit.
>
> Lose arguments and get personal...What a Dubya tactic....

   somethin' sincrap no well. dat why he call da salad a faker when he
show sincrap no nothin' bout video markett. dat why he call dan a homo
an' a schizo when dan reveal how little sincrap no. sincrap not only big
fat liar chickenshit, he also hypo crit. him little man who try ta act
like bully in sand box. 'cept 'tari users are one kickin' sand in face.
>
> sincrap!
> somewere in mn-a gore state

   an' gore is about ta get gored...an' havin' such a big idiot like
sincrap as a supporter ain;t gonna help....

"you're english" is "you are english". It should be "your english". And it's
"than you" not "then you". You learn to spell you little c*nt!

At least people can get what i'm on about, unlike that razor moron, with his
"l33t" typing, it might look cute in his world, but it's downright idiotic
in the real world.

English isn't my native language neighter, but at least i *try* to write it
correctly.

BTW, i make the above error quite often, so shoot me

Becca Stephens <ToriFan3@email.com> wrote:

> In other words, a vote for Bush is a vote for Microsoft.

Of course I don't know US politics but what does concern me is that Bush is so pro war. I mean this defensive grid aka star wars 2? It's not going to make things safer for Americans. It's going back fire in a big way.

Oh, nobody believes we (any anti-US country) are a threat anymore, if we just triple our long range missiles some should get through. The threat is back and that's what makes them happy. But cold war 2 is not the way.

Look at North-Korea; officially they're still at war but as communism clearly is failing and millions died of hunger, they are willing to reach out. Why not hang that rice pack in front of their nose and let them linger for more capitalism. That's the way. Not rebuilding defense and offense until something blows.

We've got the beginnings of agreements here, lets build on that.
Not on a cold war 2,
not on Bush.

This NMD crap will come either way, there's not much of a difference
between the two <censored> in this respect. Not that I could think of
much where there was. Nader would make one, but probably not for long
either...
Just to give you something else as a "strawman", and not to be 100% OT
here: yes, Bush means Billyboy, Billyboy sucks, therefore so does
Bush.

SCNR!

Of course the real reason Bush == bad is because he's a liar, a drunk and a
cokehead..... Not to mention the fact that he has a level of intelligence
akin to that of a dead stick insect.

Look, I'm trying to keep my mouth shut here, as I really don't like any of the candidates this year. But insofar as being a recovering alcoholic and drug addict (actually this is the first I've heard of coke, is this thread), does anyone remember Marion Barry <sp?>? The crack addict apparently is able to do a decent enough job while straight to get another chance. Also, look at the ENTIRE Kennedy clan....alcoholics, womanizers, and we worship them....

Damn I hate double standards....

Quite a lot of native English speakers make the same mistakes, so don't feel
bad.

Regards,

Clockmeister.

Bush loves Microsoft, he even said he wouldn't tolerate something like an antitrust case against them (not that he can do alot about anyway).

BTW, i read in the newspaper today that in a school in Maryland students have to pay 20$ for computer usage, for M$ products, even if they DO NOT use them! Hilarious! I can't believe those sods get away with that.... truly the States are "silly" :)

(look at www.diamondbackonline.com for more info)

Bloody hell.. that's a hell of a long time to wait, and there's me thinking
that centuries only lasted 100 years..

The article wasn't very clear about it (the one in the newspaper), but i
suppose it could be a Uni

So basically you're saying that Bush didn't start the Gulf War, but ended it, and that it was Roosevelt who got the US involved in World War 2, and not the Japanese attack on the US.
Well, I guess that's one way of twisting history. OTOH, if we look closer at what you're saying, we see that it can also be phrased as: "every major US conflict this century ended under a democratic president, yet only one ended under a republican president". Sounds very different, doesn't it?

Marco

Well I don't find that particularly surprising, but then again I'm not familiar with how the US University (or normal school, for that matter) system works.

Here in .au you pay a semesterly fee to the university (varying from uni to uni, and calculated based on how much work you do each semester). That fee pays for the various services provided by the uni - legal aid, medical aid, child minding, computer services etc. You don't have any choice in paying this fee and a proportion of students probably never use the services it pays for (I know I very rarely have, in my 4 years at uni).

So, the idea of every student paying $20 so the vast majority of students get software free or for an enormously reduced price, does not strike me as particularly strange or bad. Heck, the vast majority probably think it's a _great_ idea.

Where's the problem here ?

> BORING PORTFOLIO
> Goodbye Apple and American Power Conversion
>
> When Apple reported Q4 and fiscal year 2000 earnings three weeks ago, it missed already reduced estimates and guided estimates down significantly for next year. Similar weakness exists at American Power Conversion, where there is now a meaningful possibility that APC's growth could stall, margins and returns on capital could continue to decline, and the company's large investments to penetrate new markets could prove fruitless. Whitney Tilson concludes that, as he's done with American Power Conversion, he will sell his Apple position.

> By Whitney Tilson
> November 6, 2000
>
> (Editor's Note: Today's article is the last installment of the Boring Portfolio. For more information, please click here.)
>
> In two columns last month (Peril and Prospects in Tech and Cisco, Apple & Probabilities), I suggested that investors take a closer look at Apple Computer (Nasdaq: AAPL), a stock I had been buying (and still own). I knew the stock was very unpopular and that I would have to put up with sardonic emails like this one: "You lost ALL credibility when you stated that you bought Apple. hahahahahaha!!!!!" Such reasoned discourse...
>
> But I like buying unpopular stocks when I believe there's a reasonable chance that the company might rebound fairly quickly from its difficulties, yet the stock price reflects a worst-case scenario. This type of bottom fishing is not my preferred long-term buy-and-hold style of investing, but when I see a situation where I think my maximum downside is a 10-20% decline and there's a decent chance of making 50-100% in a year or two, I'll often take it.
>
> I thought Apple represented such an opportunity, but the recent earnings release was truly dismal. I still think the company will rebound, but it will take quite a while and the chance of a meltdown scenario, while unlikely, is now higher than it was when I first invested. Despite this, when I first drafted this column a week ago, my conclusion was that I would hang onto my Apple stock because the valuation was so depressed.�But now, with the stock up 27% from its recent bottom, the price is not as attractive and I will sell because I believe there are now better places for my capital.
>
> Though this investment did not materialize as I had hoped, I do not view

> it as a mistake. It was a good bet that didn't happen to pay off. Though the news from Apple has been awful since my investment, the stock price already reflected that so I am selling at approximately the same price at which I bought.
>
> Apple's Earnings Report
>
> Apple preannounced at the end of September that its Q4 revenues and profits would be lower than anticipated, and reset earnings expectations at $0.30 - $0.33 versus prior expectations of $0.45. The stock was cut in half the next day. I bought a modest position shortly thereafter because, as I discussed in my earlier columns, with an enterprise value equal to a mere 4.6 times trailing free cash flow, I felt that there was little downside and that any good news could send the stock up substantially. In particular, I thought that there was a reasonable chance that Apple would do what Intel did recently: preannounce an earnings shortfall, but then beat the reduced expectations. At the very least, given its cash horde and depressed stock price, I expected Apple to announce a major share buyback.
>
> Unfortunately, Apple's earnings report was truly dismal. Sales and margins were even weaker than expected, so the company committed the unpardonable sin (on Wall Street anyway) of missing estimates that had already been reduced. Apple also guided revenue and profit expectations far below what had been expected: a "slight profit" next quarter (versus expectations of $0.45) and $1.10 - $1.25 for the entire year (versus expectations of $1.73). Finally, the company did not announce a huge share buyback -- CEO Steve Jobs merely said the company might buy back some stock from time to time.
>
> This is inexplicable. Apple has more than $4.0 billion of cash and short-term investments (equal to $11.13/share), $786 million in "non-current debt and equity investments" ($2.17/share), and only $300 million in long-term debt ($0.83/share) -- a net of $12.47/share, equal to 56% of the current share price (all prices as of Friday's close). Thus, Apple could buy back nearly half its outstanding shares and still have plenty of cash left over. In my mind, there can only be three explanations, none of which I like: a) Apple thinks it might need the cash to cover future losses; b) it wants to keep its options open for an acquisition; or c) it's not very concerned about allocating capital to maximize shareholder value.
>
> All of this being said, the stock remains quite cheap. Even if you assume the investments are only worth 1/3 of their carrying cost on the balance sheet, the enterprise value is only $11.23, or about 9-10x EPS estimates over the next year.� That's attractive, but at $17.50 less than two weeks ago, Apple's enterprise value was only 5-6x next year's estimated EPS.
>
> Clearly, the market is pricing into Apple's stock today a not insignificant probability that the company continues to decline into unprofitability, as it did during its worst years of 1996 and 1997 when net losses were a combined $1.9 billion. I did some research on these years though, and it's interesting to note that Apple was cash flow positive in both years. Also, in the past five years, there has only been

> a single quarter when Apple had more debt than cash on its balance sheet
> (on 3/29/96, Apple had $592 million of cash and short-term investments
> and $655 million of short- and long-term debt), so contrary to popular
> myth, it's hard to argue that Apple was on the verge of bankruptcy even
> during its darkest days.
>
> I have posted on the Apple message board some thoughts on why I think
> Apple's long-term future might not be as grim as the market currently
> thinks, as well as my take on Steve Jobs.
>
> ### Sale of American Power Conversion

You are arguing from ignorance. It is absolutely not the case that any algorithm can be threaded so that it can execute in parallel on multiple CPUs. In addition, many algorithms fail to scale perfectly even if they can be threaded, due to synchronization points.

Be's marketing weenies probably did want people to believe the opposite, for obvious reasons.

Render unto me a fucking break. That's a $7500 *system* composed of a $4000 monitor and a $3500 Macintosh. 22 inch LCD monitors happen to be quite expensive.

If you were smart, you would have quoted me the maximum price possible by custom configuring a system -- that way you'd easily be over $5K on just a computer. As I think I may have mentioned before, Apple overcharges horribly for RAM, HDs, and so forth through their online store.

To reiterate, the point was that Apple's machines don't cost $5K any more. Obviously, you can load them up with extra stuff and make them cost that much, just as you can easily spend $5K+ on a single PC at <pick your favorite major name brand cloner>'s website. But you wanted to argue that Apple's computers cost $5K or more by default, as they used to in the bad old days:

===

1Ghz Macs will set you back similarly these days actually.

===

Care to admit that you were wrong yet? The standard configuration of Apple's high end Mac (not a system, just the Mac, keyboard, and mouse) retails for $3500. This is considerably lower than Apple's prices for comparable Macs in the past, which did often retail for $5K or more. I seem to recall that the Mac IIfx and Quadra 950 debuted with prices closer to $10K.

You never quoted a single price in this thread until the $7500 one just
now.  You simply strongly implied that Jared Falvo's post about the price
of modern Macs relative to past Macs was incorrect.

You were wrong.

I'll guess Viet Nam and Richard Nixon. Do I win? ;-)

Hmm. The one war we lost was lost under a Republican administration.
The century's two greatest military triumphs-- the victories in the two
World Wars-- were acheived under Democratic administrations.

Personally, I think it's coincidence, but if this is the way you want
to compare the two major parties, go right ahead...

Xref: supernews.google.com comp.sys.atari.st:4182 comp.sys.atari.advocacy:227

once again, it's time for the famous Toronto Atari Federation Flea market!

yes, on Thursday, November 16th from 7-10 PM, come in and see what there is to offer in all things Atari! Looking for hardware, software, or a rare item? Chances are you'll find it here! Need to sell something? You can do the same here as well, we supply the tables! Sell your old stuff, find yourself a treasure! And do so while rubbing elbows and talking with fellow Atari users!

Ken Macdonald will be there to demonstrate and sell the latest in Mario Becroft's products for utilizing modern hardware on your classic Atari, from mouse and SVGA adaptors to the new multi-outlet MIDI device to the QWERTY-X keyboard/mouse adaptor. We hear he may even demo some software on his tricked-out Falcon.

Dan Dreibelbis will be there as well - he's got his photos back from his New York City vacation, and he'll be showing them off with some interesting commentary on what went down.

Please note: as always, TAF does not support piracy or selling stolen goods. Anyone attempting to sell stolen software and hardware at a TAF Flea Market will be dealt with within the full extent of the law!

So come in and be prepared to sell, buy and browse, and have a grand old time at the Flea Market! See you there!

The TAF meeting will be held in the Silver Room underneath the library in North York Centre at 5120 Yonge Street - parking facilities available within the Centre. Those who wish to take public transit can take the York/University/Spadina line to North York Centre Station.

No offence guys, but the cold war was just a waste of dollars

Just out of curiosity, why did you guys ever started that?

You would have gotten involved sooner or later anyway, imagine what would
have happened if the States didn't get involved, Germany would most likely
have taken over Europe, and what makes you think they would have stopped
there?

It was a cool marketing campaign though.  Just think how many dullards
bought nuclear shelters in the 60s... :)

I would even replace "particularly" by "only". You got involved in WW2
because the Japanese attacked you, thus declaring war.

As did those that started under Democrats (WW 1 and 2, as stated above).

However, these wars are all wars that most right-wingers consider noble causes, though Pat Buchanan disagrees wbout WWII.

Let's see:

WWI: the US stayed out of that one until 1917, and it ended in 1918, all this involvement being during Woodrow Wilson's Presidency.

WWII: the US only got into the war after the attack on Pearl Harbor in 1941; the opponents of involvement before then were usually Republicans. FDR and Harry Truman were Presidents during that war.

And given the hatred that many right-wingers have for FDR, one wonders if they would have been Brooklyn-Boys-style Fifth Colunmists back then.

Korean War: supposedly a noble cause.

Vietnam War: same here. And while it was being fought, the Republicans thought that it did not go far enough. And Nixon ended it by pulling off a version of the Aiken solution: declare success, then pull out.

I think it's Mikhail Gorbachev who deserves the bulk of the credit,
by choosing to allow the USSR's Eastern European empire to go free, and
for trying to create what he considered good Communism at home. Reagan
does deserve credit for turning around and coming to trust Gorbachev,
however.

Nixon, however, kept the war going for 4 more years, including a
massive secret bombing of Cambodia.

G Swaine wrote in message <8ukubu$14gc$1@news.comnet.co.nz>...

OK, I had promised myself I wouldn't continue in this thread. Steve, if you are reading, you were actually right, it shouldn't be here.

>"someone isn't screwing up the atari as bad as they are the amiga right
>now"
>
>How?

Yes, that is a fairly decent summary of my opinion.

>Is it simply the "we're spending $$$ to buy Amiga", six months later
>"we're losing millions, let's sell Amiga" cycle they're in? (Re: Atari
>to ?? to Commodore to Escom to ?? to Amiga Inc to ???)

I only became an Amiga enthusiast (pc only up until this point) right about as this started. I had thought that the gateway purchase would be the worst, certainly nothing could outdo gateway buying them so they could cannibalize patents, and if we're lucky release some i-opener like net appliance with the amiga brand.

Damn was I wrong.

No, the worst part is the current owners, and that it looks like they may just release an Amiga-branded machine/software. However, the brand will be the only thing left of the amiga.
Their OS will be ditched, and you should hear some of the lame arguments that I do, in defense of this move. "Oh, it would take so much to update it, that there is no way to keep it! It's 15 years out of date!". This from the same people that 3 breaths ago were claiming that Amiga all but invented the GUI and invented all of the features that windows95 later stole (which to a less exaggerated extent, I believe).

Their hardware platform will be completely ditched. This is more justifiable. The 68k is end of life, of course. They'll farm it out to a 3rd party (this may be the one wise thing that they do). There can be no arguments with these statements, from me or the more rabid "anti-Pseudamiga" crowd. However, there is more to the new hardware than just this. I personally feel that the new hardware lacks several necessary criteria for it to qualify as next generation amiga hardware. Further, the new hardware will be incapable of running AmigaOS 3.5. Backward compatibility shouldn't be absolute, but in this case its warranted to show continuity. Certainly the new "OS" won't run on the old hardware. Also, while the new hardware can hardly ignore PCI, there is not a single legacy Zorro slot, even though many amiga enthusiasts have paid dearly of amiga expansion cards. And don't get me wrong, it's not entirely a practical want, either. It would show that this isn't some generic pc box running a funky os, but rather a new model in an older family of computer. Finally, the hardware is just an afterthought, as they intend to be a software-only company, and they are catering more to other platforms than their own! As far as that goes, my understanding is that with the "virtualized OS", that it won't even truely run native on their own hardware.

Amiga users don't care that the same apps can easily be run on a mac or pc, and mac and pc owners will certainly care less (the Borg cube cruises merrily along, folks). They are catering to people who laugh at alternatives because of feigned sophistication, and ignorance that you could actually prefer something else. Why? They want marketshare, which leads to quick easy riches in our economy today. Rather than rely on technical excellence, and a superior platform, which could make inroads in some niche markets, they are taking the coward's and con artist's way out. And they are whoring the amiga name to do it.

Think of it like this. Grandpa dies. Everyone is sad that he is dead. Some sheister offers to ressurect grandpa, wouldn't that be a wonderous miracle! Instead, grandpa is a zombie, going around eating the grandchildren. Maybe it's not so great he is back, if it's like this. This doesn't mean you wouldn't want him back, if it could be a true ressurection though. This a good metaphor for the amiga situation.

The atari, despite all the minor embarrasments that every platform suffers, has been spared this indignity. Consider yourself lucky.

John

... little big competition
... The Atari Three In One.
... dedication. skill. creativity.
... http://www.magicos.de/lbc.html

sponsored by: st-computer +++ Paskud +++ AtariFan +++ Therapy Seriouz Software +++ DurSoft +++ Patrick Eickhoff +++ Triple a Mag +++ Woller GmbH +++ Didier Mequignon +++ RGF Software +++ Application Systems Heidelberg +++ Mario Becroft +++ More to come!

1 .: introduction

Following the enormous success of last years MagiC Game Contest, MagiC Online and the place2be are proud to present their next generation competition, that will once again unite the existing community and breathe new life into the Atari platform.
This year the organizers are able to provide not just one contest, but three. Besides two coding contests, the "Little Big Competition" also features a special graphics contest in cooperation with the Atari Icon Library.

Dedication, Skill and Creativity. The Atari 3 In One.

2 .: big ports, little helpers and a new look

We have decided to split this years contest into three categories.

.. big ports

The aim of this contest is to create the best possible software port to the Atari platform. There is an abundant amount of quality software packages available, complete with sources, waiting to be ported to our platform. Why not take the challenge to create the best possible Atari version?

- see rules for the exact requirements of the port

.. little helpers

The aim of this contest is to create a (relatively) small and useful tool

or
utility; a program which simplifies everyday use and/or increases overall productivity. Interested entrants may examine features from other platforms, deciding to merge the best features of these systems with the elegance of the Atari environment. More Creative participants may choose to implement their own innovations; innovations that will dramatically increase the ease of use and/or efficiency of certain tasks. Will you be the one who revolutionizes the Atari platform?

- see rules for the exact requirements of the tool/utility

.. a new look

Every user is not a skilled programmer; but every user is equally important to the survival of our platform. This contest celebrates this fact by encouraging the use of artistic and aesthetic skill: to create a modern new look for the "Atari Desktop 2001". For a long time, the Atari desktop has been a eclectic mixture of Icon Sets, background pictures, and winframes which were mainly adapted from other platforms. Our aim is to create a new coherent and original looking desktop. So here's the plan:

- icon set

Originally, the Milan II had planned on introducing Glow Icons to the Atari platform, but now it's up to us. The first part of the Atari Desktop 2001 competition is to create the best looking set of glow icons. If you are not familiar with this style, you are encouraged to view the sample images of some Amiga conversions on the compo-pages. (Courtesy of Joachim Fornallaz)

- background pictures

Create the best looking background picture for use in our favorite Atari desktops.

- winframes

N.AES 2 and MagiC 6 both introduced the possibility to change the appearance of the window elements by using winframes. So the aim is to create the best looking winframe.

- see rules for the new look contest for the exact requirements

Any individual who wants to take part can contribute to one of the subcontests mentioned above. You don't have to create an icon set, background picture(s) and winframe(s). At the end of the contest the Atari Community will separately vote for the best icon set, picture and winframe. After that we will compile a package out of the best contributions (and possibly fill in some Amiga glow icons, which otherwise might be missing) into the "Atari Desktop 2001" package. All icon sets will be added to the Atari Icon Library.

3 .: little big sponsors

Our contest wouldn't be possible without the kind help of our sponsors.

Here is the place to say thank you and introduce:

st-computer (http://www.st-computer.net/)
st-computer is the largest Atari computer magazine in circulation. With a full-color layout, professional staff, and a generous spirit; st-computer is truly a winner.

Paskud - Grzegorz Pancher (http://www.rsi.pl/paskud/)
Grzegorz Pancher is a popular musician who has utilized the powerful elegance of the ST in a Studio-setup to produce some very popular polish CD's. He shares his passion for Atari computers with others by producing and selling several products, (including an IDE interface for the ST and Falcon RAM cards) and servicing Atari computers. "Paskud" has generously sponsored (5) of his ST IDE interfaces (for HDD and CD-ROM).

AtariFan (http://atari-fan.idz.pl/)
AtariFan is the premiere Polish magazine that has already established a proud name for itself, even in its infancy. They are kindly sponsoring a free subscription of AtariFan for the year 2001 with a free CD.

Therapy Seriouz Software (http://www.therapy-seriouz.de/)
Therapy Seriouz Software are the developers of Smurf, the graphic manipulation program that blows away its counterparts in both functions and speed. They are kindly sponsoring one full copy of Smurf.

DurSoft (http://dursoft.atari-computer.de/)
DurSoft Developments has made it possible for all Atari computers to take advantage and utilize Digital Cameras. By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with one full copy of PhotoTip
By packing features into PhotoTip, DurSoft has provided all of us with the definition of quality software. DurSoft is supporting us with the one full copy of PhotoTip.

Patrick Eickhoff (http://funmedia.atari-computer.de/)
Patrick Eickhoff is the developer of the great multimedia tool FunMedia. It has been in development for some years now and proves that you do not have to stray away from the Atari platform to have access to innovative multimedia tools. Patrick is kindly sponsoring one full copy of FunMedia (on CD)

Triple A Mag (http://www.triple-a-mag.de/)
Triple A Mag, the once Atari-only magazine, has recently expanded its horizons and now covers the Amiga, Atari, and Acorn platforms. Their attention to detail and support is outstanding, and so are their contributions to this competition. Triple A is supporting us with 100 DM in prize money and 3 full subscriptions.

rgf Software (http://www.rgfsoft.com/)
Richard Gordon Faika is one of the most active Shareware authors for the Atari platform. Tools like Arthur or the outstanding editor Luna are in daily use by many Atarians. Richard sponsors two "Moon"-Packages which include Arthur 2000 (+ all libraries), the latest Luna version and the

latest release of the Luna Text Compiler. Worth 174 DM!

woller systems (http://www.woller.com/)
woller systems is a well respected Atari dealer as well as the initiator of many new products for our platform. Some of their products are: N.AES, GEM-TV Milan, Milanblaster. Like last year woller is generously sponsoring 3 copies of N.AES.

Application Systems Heidelberg (http://www.application-systems.de/)
Information pending

Mario Becroft (http://gem.win.co.nz/mario/) Mario is the well known hardware (and software) developer that continues to release must-have products at affordable prices. Whether it's connecting a PC keyboard to your ST or adding some extra Midi ports, Mario has just what you need. Mario kindly supports us this year with one Atari and Amiga serial mouse interface.

Didier Mequignon (http://perso.wanadoo.fr/didierm/)
Didier is an extremely gifted programmer who constantly pushes our platform to the edge, as is evident with his many essential programs. AniPlayer, his main project, has introduced many users to the joys of multimedia movies and digital sound. Didier is showing his support with (3) registrations to Aniplayer.

We have not yet decided which prizes will be given to what contest. But we will keep you informed. If you would like to support us by sponsoring our contest then feel free to contact us!

4 .: registration and support

If you want to take part in one or more of the contests, then please register by filling out the form on the compo-pages. This is needed to decide whether to skip one of the contests or not. You have no obligations after registering, it is just for information purposes. It also helps to verify that no one works on the same port.

It is also possible to register for the contest as a team of people (to be able to finish bigger projects). Just enter the names of all team members separated by a comma into the registration form. Although you won't receive any help from us when it comes to deciding which team member gets what prize.;-)

Any individual can contribute with several productions to all three contests. It is possible to work for one or more teams and on one-man productions. Whatever, just be productive.;-)

If you register you also have the option to receive free newsletters from us, which keep you informed about the latest contest news (new sponsors etc.).

This year we are also able to offer a free translation service to all our contestants (kindly provided by TransAction and DDP). This way we can assure that the user interface (probably even the manual) of all contributions is available in all major languages.

If you need beta-testers (with a certain system configuration), feel free to contact us and we will see what we can do.

5 .: rules

.. contributions

big ports and little helpers

- All programs must state that they were "Produced for the "Little Big Competition" both in the readme's and Info Box!
- Programs may be shareware but may not be crippled in any way.
- Programs have to work under both MagiC and N.AES (2).
  TOS support is optional.
  - using extended MagiC objects is allowed as N.AES 2 supports them.
- Programs can make full use of system extensions which are freely available. We even encourage you to make your contributions support modern features like BubbleGEM, OLGA etc.
- Programs may make full use of NVDI 5's extended VDI calls
- Programs which need network/internet support of some kind may use every TCP/IP stack available for the Atari (STiK/STinG or MiNT/MagiCNet preferred).
- Porting a software may also include reprogramming a software (big ports)
- A port should either feature a GEM-interface or shell (exception: e.g. games running in fullscreen mode - VDI output still required of course). Contact us if you are unsure. (big ports)
- system requirements can be set freely (minimum processor, RAM, resolution etc.). Note: People who can't use your software won't be able to rate it. On the other hand people who see software pushing their 060 to the limit might be very happy and give high rates to your software.
- Adding hardware specific parts (e.g. direct screen access) is only allowed as an optional feature to speed things up on original Atari hardware.

new look

- the icon set needs at least 12 entries
- icon sets must offer 2, 16 and 256 colour versions of their icons
  - 16 and 256 colour versions have to glow
  - other animated features are optional
  - NVDI 5 palette has to be used
- icons have to be your original artwork (no conversions from other platforms!)

- background pictures can have any of the following standard sizes: 640*480, 800*608, 1024*768
  (supporting several resolutions is welcomed)
- NVDI 5 palette has to be used for 16/256 colour pictures
- colour depth can range between 1-16 Bit
  (supporting several colour depths is welcomed)
- pictures have to be your original artwork
  (scanning is allowed)

- you have to create the winframe(s) for both MagiC and N.AES (2)
  - see the example archive which contains a MagiC and N.AES winframe
- winframes must support all colour depths
- NVDI 5 palette has to be used
- winframes have to be your original artwork (no conversions from other platforms!)
- Instead of making a standard MagiC winframe you can also make an enhanced NatFrame winframe as NatFrame is free.

.. voting

An exact description and rules for the voting procedure will be included to the vote forms.

6 .: deadline

Deadline for all contributions is May 12th 2001. No contributions will be accepted after this date.

Contributions shouldn't be released before the deadline, otherwise we'll have to disqualify this entry.

Absolutely no contributions that are publicly released prior to the May 12th deadline will be accepted. This includes public "alpha" and "beta" releases. The aim of this competition is to spark the creation of /new/ software and "themes" for our platform, therefor, no existing programs, icons, winframes, or Background images may be updated and entered into this competition. Failure to comply with this rule will ultimately result in disqualification. Entries may not be released prior to the deadline to ensure equality and fairness to everyone involved. All entries will have the same timeframe to be tested and voted upon. Furthermore, until the official closing of the competition and judging, ALL programs/sets will ONLY be available in a single archive. Individual downloads will be made available after this time. All contributions will be available for download on May 13th from the compo-pages.

7 .: the team behind this years contest

This years contest has dramatically grown in size and we are glad that some loyal Atarians offered us their support and help. So here is the place to introduce:

Bengy Collins (http://magicos.de/)
Co-Organizer Bengy Collins runs one of the largest English portal sites, Magicos.de. Bengy also has a monthly column in the German ST-Computer magazine. Co-Organizer of last years MGC 99.

Jan Daldrup (http://place2be.de/)
Jan Daldrup runs the largest International portal site, place2be.de. Jan works for the German st-computer magazine. Co-Organizer of last years MGC 99.

Joakim H�gberg (http://gokmase.atari.org/)
Co-Organizer of the "...new look" subcontest, Joakim is the Father of the "Atari Icon Library" and continues to prove beneficial to the Atari community by his continued work on essential utilities. Him and Dan Ackerman are currently working on aICQ.

Rafal Kawecki (http://kawecki.atari.org/)
Rafal is the webmaster of a popular Polish news page and will represent our contest in Poland. He translated the contest pages, kindly provided us with sponsors and manages the contact with Polish authors.

st-computer - Thomas Raukamp (http://www.st-computer.net/)
Thomas Raukamp, current editor in chief of the largest paper based Atari magazine left, gives us the opportunity to constantly inform all readers of st-computer about the contest. Thus we are able to reach a far bigger number of Atarians including those without Internet access. st-computer is also generously sponsoring the contest.

TransAction (http://transaction.free.fr/)
DDP (http://www.cix.co.uk/~derryck/index.htm)
TransAction and DDP are crews of people who support the Atari Community by providing high quality translations of recent software releases. This year they also kindly help all contestants of the coding competition by freely offering their translation service to them.

Joachim Fornallaz (http://omnis.ch/jf/)
Joachim Fornallaz, the respected author of essential utilities and Milan webmaster, has kindly volunteered to create a custom GEMSetup Installation routine. The custom GSU will ship with the final LBC archive and will allow for easy and uniform installation.

Take care,
Bengy

mark wrote in message <8351120326301236.NC-

>Is a Mac just a generic PC box because they went from Nubus to PCI?

Hmm. No. But that's not exactly fair. Imagine that Apple had done things differently, and that they ditched Nubus, the 68k, and the MacOS 1.x-9x codebase all at once. If they had, I would have trouble calling it yet another macintosh, instead, I'd be forced to think of it as the 3rd platform Apple had created.

That they did all those in phases, says to me that even the lowly Mac 128k is a macintosh, along with the g4 cube.

Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5 codebase all simultaneously... not even a single transition amiga model. What's more, OSX still has some backward compatibility to the MacOS classic stuff. AmigaDE... hell, I don't even know how to describe it without spewing that sickening hype and PR crap. They are more interested in their ill-concieved "let's redefine computing and OS's" bullshit, than they are in building a "new amiga". If Apple were to have built that hypothetical 3rd platform, it would still be a computer, albeit a new platform. Pseudamiga isn't even doing that... with their MAME of operating systems.

There are certainly 2 ways to look at this. One, Apple had plenty of uninterrupted time, in which to space things out, and do each single thing at a time. Amiga, however, has been pretty turbulent, and if they are to "survive" it will be necessary to jump ahead, and do all of these things at once. This is what others will claim, and I'll save them the trouble by stating it for them... but it just isn't true.

Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip stacks, etc... are all integrated into win2000 or OSX. With amiga, if they exist at all (and I'm not talking just protocol stacks) they are 3rd party add-ons. This could be a problem. Then, you have a file system that can't come close to handling the 50+ gig hard drives that are now popular and cheap. 3d framework, ala openGL or direct3d? Not there. I can see that this will take alot of work. I am not blind. But rather than write the next version, they are ditching it!! If you have an incomplete project, that is 90% unfinished... that's alot of work, but do you abandon it, and start a new one, that by definition will have even more to do (90% vs. 100%) ??? Besides, the amiga gui shell is still pleasing, and capable. There are parts of the api that are worth keeping. And even if it isn't, then write us another OS! I would think it unwise, but I can see why some would want to do that. But they aren't. AmigaDE is an attempt to redefine the OS. They don't want to write a true OS, because getting into an OS war vs. Microsoft on the low end, and UNIX on the high end, is a war that no one can possibly win. We don't need the OS "redefined" though, even if such a thing can help M$ in an anti-trust case (the browser is the OS, haha). And they don't need to fight this war. Cater to the amiga enthusiasts, and the people who like to try something different. And this does't even take into account the lack of a Zorro slot. What's the cost of this? $1 for the connector, $5 for the board space, and maybe a $2 pld?

I've came to the conclusion that it isn't that it's too costly or difficult to show some continuity, but rather that for whatever reason, they want none. Maybe they're embarrased by it, or the things that made Amiga "amiga" just don't fit their engineering philosphy. O maybe, they just needed a name, and were too lame to make one for themselves.

John

 Those probably the ones who realized how close the world
 actually came to a nuclear war in 1962.

 Regards...

Good heavens spare us all :)

> Damn was I wrong.

Yes, the future might even be bright this time

>   No, the worst part is the current owners, and that it looks like they

Humm... i completely disagree there, sofar they've done as they said, we saw
OS3.5, soon OS3.9, the AmigaONE specs & soon the AmigaONE upgrade for
current Amiga's...
Seems they're doing fine

> may just release an Amiga-branded machine/software. However, the brand
will
> be the only thing left of the amiga.

I think it's to soon to make such conclusions, if the OS behaves in a
simular fashion, and has backwards compatibility, i'm happy

>   Their OS will be ditched, and you should hear some of the lame

arguments

Me too would love to see the current OS survive, but i'm not going to shoot down the "new" OS until i've used it, just look at Windows9x & NT, they both act & look the same, but what's under the hood is quite different

> that I do, in defense of this move. "Oh, it would take so much to update
> it, that there is no way to keep it! It's 15 years out of date!". This from

15 years? Hello? The only things lacking is Memory protection & VMM

> the same people that 3 breaths ago were claiming that Amiga all but invented
> the GUI and invented all of the features that windows95 later stole (which
> to a less exaggerated extent, I believe).

M$ has been steling stuff all the time (GeoWorks anyone?)

> Their hardware platform will be completely ditched. This is more
> justifiable. The 68k is end of life, of course. They'll farm it out to a 3rd

Not only is the 68K obsolete, the whole chipsets are

> party (this may be the one wise thing that they do). There can be no
> arguments with these statements, from me or the more rabid "anti-Pseudamiga"
> crowd. However, there is more to the new hardware than just this. I
> personally feel that the new hardware lacks several necessary criteria for
> it to qualify as next generation amiga hardware. Further, the new hardware

Why is that? What would you call Next-Gen Amiga? Z-5? :)

> will be incapable of running AmigaOS 3.5. Backward compatibility shouldn't

This is still an unkown fact, and the current AmigaONE upgrade for the A1200 & A4K provide backwards compability, what we do NOT know is how performant it'll be

> be absolute, but in this case its warranted to show continuity. Certainly
> the new "OS" won't run on the old hardware. Also, while the new hardware can

See above

> hardly ignore PCI, there is not a single legacy Zorro slot, even though many

Zorro slots are obsolete, you don't find ISA slots in new PC's anymore neighter, and god forbit it if you want VLB

> amiga enthusiasts have paid dearly of amiga expansion cards. And don't get

> me wrong, it's not entirely a practical want, either. It would show that

> their own hardware.

The OS itself runs natively (the HAL layer) but the apps don't, although
they can be made to run native (eg for games, these can use CPU specific
tricks like Altivec or MMX)

>   Amiga users don't care that the same apps can easily be run on a mac or

Hell no, Amiga Inc has shown more bravery then M$ ever had, they want to
move the platform forward, and they might actually pull it of

> Think of it like this. Grandpa dies. Everyone is sad that he is dead. Some

But the amiga ain't dead yet, you could look at the Amiga as a cancer
patient, with tumors running amoc in herbody, while he fights for her life,
refusing to give into death

> The atari, despite all the minor embarrasments that every platform suffers,
> has been spared this indignity. Consider yourself lucky.

The indignity of a possible survival? Sure

Hmm.. Take a close look at MacOS prior to 8.x, does the name carbon sounds
familiar? They've been preparing their move towards BSD since 8.x

> That they did all those in phases, says to me that even the lowly Mac 128k

> is a macintosh, along with the g4 cube.

Amiga Inc, unfortunatly, doesn't have this luxury, a very small (shrinking) market isn't viable for a bussinness

> Compare to the Pseudamiga. They are ditching zorro, 68k, and AmigaOS 3.5
> codebase all simultaneously... not even a single transition amiga model.

AmigaONE upgrades for A1200 & A4K, AmigaOS3.9... sounds like they're doing there best to me

> What's more, OSX still has some backward compatibility to the MacOS classic
> stuff. AmigaDE... hell, I don't even know how to describe it without spewing

That's because you know zip about it

> that sickening hype and PR crap. They are more interested in their
> ill-concieved "let's redefine computing and OS's" bullshit, than they are in
> building a "new amiga". If Apple were to have built that hypothetical 3rd
> platform, it would still be a computer, albeit a new platform. Pseudamiga
> isn't even doing that... with their MAME of operating systems.

Are you so scared of new technology? Or can't you see the bigger picture?

> There are certainly 2 ways to look at this. One, Apple had plenty of
> uninterrupted time, in which to space things out, and do each single thing

> stating it for them... but it just isn't true.

It is, you're just to blind to see it, Amiga Inc doesn't have 5 years to move their OS to a new CPU, and to implement new API's that'll be used in the new OS

> Think about it. AmigaOS 3.5 is aging, certainly. Many components, tcp/ip
> stacks, etc... are all integrated into win2000 or OSX. With amiga, if they
> exist at all (and I'm not talking just protocol stacks) they are 3rd party

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY.

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:

: READING THIS COULD CHANGE YOUR LIFE! IT DOES WORK!

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I

: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1) Steve Wehvila
: 3155 Vernon St.

: Duluth, MN 55806

: #2) Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #3) Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #4) Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #5) David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #6) Webster Lessard
254 Clarks Mills Rd.
Hollis, Maine 04042

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list

: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6

: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

i worked for a friend of mine this weekend who is a wholesaler of pc, and apple software at a show that was done at the mn. state fair.

there was not one piece of apple hardware there, last year there was a few.

there was one apple software dealer there who i have met before(none of the rest showed up), and i asked how it was going, and he said that the apple market is doing ok, nothing great, but that he was buying, and selling pc software now.

that brings to my mind the pathitic state that atari was in by the early 90's.

here was a company that at one time had the second largest software producer, and distributer in the world(atarisoft).

then a mere 6 years later was relying on mac, and pc software for there last machine produced.

who cares about your machine then, why not buy a cheap pc, what users want is software that is unique to the architicture of the machine, not a second hand bloated bug ridden piece of pc junk.

i think apple should really be more involved in real production of software for there machines before its to late.

there is just a blizzaerd of pc software, it was even cheaper than last year, i saw hundreds of titles going for $3.00 or less with copyrights on the boxes 2000,1999,1998, so it was all current stuff.

there was over 50 dealers there, and only one apple dealer left.

apple has no wiggle room anymore for mistakes, the pc world is junk, i agree, but its everywhere, and its current, and its cheap.

the apple is about to become a hobby machine, and that would be a crime, because then no one produces software that can be kept current, just ask any atari dealer/user, or commodore dealer/user.

Uh, maybe Apple users hold onto their hardware much longer. Or could it be due to eBay?

> there was one apple software dealer there who i have met before(none of

Ever hear of mailorder? I must get upto 10+ catalogs per month from Mac Mall, MacConnection, MacWarehouse, Club Mac etc...

Did you check with CompUSA and First Tech?

> that brings to my mind the pathitic state that atari was in by the

Don't compare Atari to Apple...Not even close. I suggest you visit the Twin Cities and visit the likes of Micro Center and the CompUSA's...

Have you ever installed PC software on a beige box? You might want to
check out http://www.AmbrosiaSW.com/news/

> there is just a blizzaerd of pc software, it was even cheaper than last
> year, i saw hundreds of titles going for $3.00 or less with copyrights

Junk that could not survive on full retail price. I think that is an
advantage..

> there was over 50 dealers there, and only one apple dealer left.

Your point? Maybe that people keep their old macs when they upgrade to
new ones. I have observed this...

> apple has no wiggle room anymore for mistakes, the pc world is junk, i
> agree, but its everywhere, and its current, and its cheap.

I have heard this for the past twenty years...

> the apple is about to become a hobby machine, and that would be a
> crime, because then no one produces software that can be kept current,
> just ask any atari dealer/user, or commodore dealer/user.

You need to visit the Twin Cities...No such thing as a specific hobby
machine anymore...

ah but i do visit the twin cities, i live just 20 minutes from downtown mpls./st.paul.
i am a mail order house for atari products, so i am quite aware of how mail order works, and how people would rather browse, and pay right on the spot for software.

i am not so sure that the software at the show was junk, having been in the business for 17 years, i recognized many of the software companies that put out the software that i saw, and it was plentifully, and cheap.

what i am trying to say is that the world is flooded with cheap(pricewise) pc software, and a lot of it is good enough quality to make the average consumer happy at a buck a pop.

shows like that are done every where all of the time, it used to be that you could find other platforms, and software, but not today.

my point is that apple is swimming in a uphill battle with higher prices, and simply cannot do it on there own, and its beginning to show.

a few stores carrying apple software is nice, but when your neighbor comes home with $50.00 worth of software, and his kids have to help him get all in the door, and you paid that for one piece of apple software, get my drift.

maybe apple should be happy if they could have some small clone platforms to get more software development, its either that, or die.

the PC is a giant freight train that cannot be stopped, and will roll over everything by just sheer numbers alone, apple needs some help.

Hi,

I just won a bid recently on an Atari Jaguar and just received it in the mail today.
The box was never opened... factory sealed with a holographic sticker.
Anyway, there was no manual.
Since a game cartridge is NOT inserted into the Jaguar, it won't power on right?
I don't have any game cartridges yet for it. I've set it up and and when I power it on, the light will not come on. Is this normal?

Any help would be greatly appreciated.

Thanks,
g'day

Hi

The Jaguar won't power up unless a cartridge is inserted, and that's
it's inserted correctly. Brilliant idea I wish other console followed:)

what milan fiasco? razor realize it simply slight setback - milan talkin' 'bout looking at g3 an' g4 as well.

razor wish amiga scene luck - dey'd need it, after all da vapor ware dat's scattered dere road since 1993. 'member cow computer sincrap say would crush atari? turn out it vaporous as sincrap wind comin' out back end.

look like game of dodgeball fer sincrap. 'specially since sincrap embarassed about fiasco in own backyard regardin' cube, crapple tankin', imac tankin' . even jobs admit dey have too many imac in channel. why no sincrap - is because he yellow.

   never was vapor sincrap - dey show prototype, people actually handle.
Where cow amiga when sincrap claim crush milan? only exist on paper.

   vapor is new cheap cube an' g4 over 500MHz jobs promise ta angry
stockholders. where are dey, sincrap?

> >   look like game of dodgeball fer sincrap. 'specially since sincrap

The G4 Cube has been shipping over a year....Were can you get a Milan on
this side of the Atlantic?

I don't really see any reason to ressurect the ST. The OS hasn't changed in years, and nobody is writing new software for it. The "new" Amiga is under development, and I see it failing for the same reasons.

If you do have the resources to build a Power PC based 1040ST, why not use them to build a totally new computer for the 21st century? Let's leave these old computers in the dust and build something that can topple the wintel empire.

How about an ATX board with up to four 1GHz G4 processors, six PCI slots and one 2x AGP slot, and all the latest goodies that are on PC motherboards, along with a G4 version of Linux?

jared,
it ain't gonna happen.
 i like all atari computers, i and others have looked into doing this,
its just to expensive in the u.s.a.
 the market here is to fragmented, and everything is peecee.
 the market here is a cattle market, like all markets in the u.s.a., we
have little or no free thinkers here, plus jack the idiot let it slide
thru his greedy greasy fingers, atari actualy had a name before he came
along.
 i get calls all of the time from people who come across
st's,tt's,falcons's,XEGM'S lynx's, portfollio's, jaguar's, and they want
to know when they came out because when they bought there 2600, they did
not see those units in the stores and they know that atari went out of
business in 1984.
 if a clone company from europe was smart though, they would market
there clones in english here in the us/canadian market, there would be
some sales, not all people in the u.s.a. are cattle, and many business's
still use atari technology.
 that would help there bottom line to keep developing tos hardware, and
to avoid debacles like the milan II, that was handled in true jack form.
 i want a true multi-processor machine that does not require all data to
be sent to some monster power hungry processor that is really not
designed to to any more than add, and subtract, and lock up from monster
bloated code,
thanks,
lance

funny sincrap - as well as spellin' problems, it obvious ya cant read either

first - how can g4 cube be shippin' over a year, when it only announced at macworld last july, an' only started shippin' in septmbr?

secund, jobs announce CHEAP cube in press conferennce, an' he make clear it won' be released til' later. razor read an' see dis on quiktime at dan's place - howcom sincrap miss dis?

anybuddy can buy milan an' import, sincrap. milan 1 still exist, still bein' built, an' can be upgrade ta faster processer. sincrap afraid of milan, dat why he tell big lies 'bout compatable an' build quality. milan 1 no vapor. cheap cube an' g4 over 500 MHz are vapor.

Apple has shipped many CPU's in the last three years. I do not have
enough toes and fingers to keep count. In the meantime, only the Milan I
has shipped out of a rock somewere in europe.

Why do buyers have to go the extra mile to purchase? Why is it soo
difficult? Why not a local purchase?

playin' dodgeball, sincrap - where is cheap cube an' higher den 500 meghurtz g4 jobs promise. until den, dey vapor. answer question, sincrap,razor aint interest in weenie-pullin' contest.

razor no call germany a rock. rock in sincrap's head.

Anyways, some (purely hypothetical) questions:

1) *IF* such a computer, with the specs I list below, were to be released... by Atari, mind you.... would you buy one, provided that you could run (at least) old ST software on it?

a) 1040ST and/or Mega ST case
b) 32-64Mb of RAM
c) ATI accelerated 3D video chipset
d) Yamaha XG audio chipset

2) If that unit came in two models; the 1040ST-styled one being less powerful than the Mega ST model, which would you buy?

a) Home

b) Business

3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for the Mega ST model? If not, what would you be willing to pay for either?

3) If Atari, as a computer manufacturer, returned, would you be excited and tell others?

Please, no smart-ass remarks or non-serious replies. I am planning on compiling the number of users that reply positively to this post and I'll post this message to other Atari newsgroups and elsewhere to see just how many people are out there that *would* be willing to buy such a system. No need to repeat reply if you visit more than one newsgroup this message is at.

If you know people that might be interested, show them this message and let me know if they are. I'll add their numbers to the list. I want to see just how worthwhile my idea is to the general Atarian/non-Atarian Internet public.

Thank you for your time...

Jared

<de-lurk>

Oh wow!

I can't believe it..

Almost 6 years since I first came into this newsgroup to read about
atari products, I stumble across a posting by sinclap.

I CAN'T BELIEVE HE'S BEEN SQUATTING IN THE ATARI NEWSGROUP FOR SIX
YEARS!!

All this, just to berate Atari stuff, or to somehow make himself
feel superior (?)

I suggest that you re-evaluate your life man, you've seriously
been wasting it down the tubes if your mission in life is to flame
people in comp.sys.atari.advocacy .. Think of all the meaningful
things you could've been doing instead, out there in the real
world..

<re-lurk>

Hypothetical in every sense of the word considering Atari as a computer
devision doesn't even exist anymore.

>1) *IF* such a computer, with the specs I list below, were to be
released...
>by Atari, mind you.... would you buy one, provided that you could run (at
>least) old ST software on it?

No. Reason? a) The ST case design is horribly dated.
b) RAM is cheap, start at 64Mb
c) The ATI chipset is only average at best
d) Go with the industry standard, that being
Soundblaster Live or similar.
>a) 1040ST and/or Mega ST case
>b) 32-64Mb of RAM
>c) ATI accelerated 3D video chipset
>d) Yamaha XG audio chipset

What processor more importantly?

>2) If that unit came in two models; the 1040ST-styled one being less

>b) Business

I think I answered that already, neither.

>3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000
for
>the Mega ST model? If not, what would you be willing to pay for either?

Well, no more then the average PC, less then $500US certainly.

>3) If Atari, as a computer manufacturer, returned, would you be excited and
>tell others?

It wouldn't excite me, especially based on your specs. I wouldn't tell too
many people either, I don't like being laughed at.

>Please, no smart-ass remarks or non-serious replies. I am planning on
>compiling the number of users that reply positively to this post and I'll

So, are you going to treat all negative comments as non-serious and not
include them in your survey? That would make for a somewhat biased survey
wouldn't it?
In any case, just the Atari name isn't going to sell too many units,
especially considering the less then impressive specs and price.

You know, I had a relatively brilliant idea hit me today (provided it hasn't already been thought of or done). Instead of emulating ST hardware, why not make a PCI card that has the ST right on it! Not just the ROMs and/or one or two parts, but 95-100% of the ST's hardware on it!

If you look at a 1040ST, there's a LOT of wasted space. Especially considering today's technology and design. You can get circuit board traces down to a fraction of what they were in the old ST. And resistors/capacitors? They're microscopic surface mount devices now. Substitute the 2 or 6 ROMs for one ROM (or a tiny, surface mount Flash ROM, like PC's use today). For the RAM, use SDRAM chips, which are much higher density and surface mount also.

For the rest of the ST parts, take them out of old ST's! Unsolder 'em all! That CPU, GLUE, MMU, and stuff. Put them on the new PCI board. If I don't miss my guess, I would say the reduction of some part numbers/sizes and trace width should reduce the overal board size to a board you could put in a PCI slot.

In order that you could run this "ST card" on a PC or PowerPC motherboard, using a standard video card, you would probably be best to emulate the video shifter, so that you can run the ST in a window on your main OS. If you kept the real video shifter, you'd probably run into problems trying to get it to work with an SVGA monitor.

Now, since the "ST card" doesn't have any ports on it, you need to write software that translates or redirects the functions of the ST (like the sound chip for the printer port) to the appropriate hardware. You might even
emulate the floppy chip in order to use load/save files to and from your main hard drive or floppy drive, etc. You would create an ST Environmental Partition (STEP) file on your main HD, that the ST card used, thinking it was a MegaFile30 or whatever. Of course, you have to have a program that gives you access to the ST Card in the first place.

Now, assuming any of these is reasonable or feasible or worth pursuing at all, we port GEM or MiNT or whatever ST-derivitive OS to PowerPC (if we want to go that route) or Intel Pentium. In the case of Intel, we wouldn't have to port GEM at all... it's already there on that platform. We'd just continue to improve upon it until we felt it was worth calling "GEM2000" (or GEMillenium or whatever).

The ST would run at full speed. The hardware would satisfy *all* software, because it was genuine, not emulated. You could probably even run those copy
protected games on diskette (assuming you have any)!

Then, we take the opportunity to use the ST Card to port as many existing apps as possible to the new GEM (or whatever OS we go with) on the chosen processor. We have the best of both worlds!

We save money on parts, because we use existing parts from old STs. I was

lucky to find a 1040ST for $5.00 at a thrift shop. The only question is...
how much would it cost to produce the PCI PCBs and transfer the existing
parts to them.

Any ideas if what I have just suggested is pure silliness or not? Seems at
least a little more reasonable than my previous ideas... hmm?

Jared

That would be great if I could get something like that for my Hades. I
would not mind even having a Pentium card either. That almost happened.

Lets see...Apple ships over 100,000 G4 Cubes last quarter and is
considered a fiasco. The Milan II is cancelled and is called a slight set
back...Whats wrong with this picture?

> razor wish amiga scene luck - dey'd need it, after all da vapor ware

> sincrap - is because he yellow.

Tankin? New word or slang? Lets see...Apple ships 570,000 iMacs, G4 Cubes/G4 Towers increased sales of the pro line by 10% over corresponding quarter according to a Znet article...

Looks like the new Amiga will be the new alternative that could derail
Milan's chances. I am sure that the new Amiga company will ship 100x
times more than milan...

> > Ooops on the G4 Cube shipping.

Are we talking about the states here? If so, Macs are available at 800+
Sears, 500 Circuit Cities, 200+ CUSA's, countless regionals and Apple
Specialist shops...Whats Milan's excuse?

sincrap not lookin' at whole picture at usual - amiga have history of vapor project since CBM go down. atari clone makers have released many machine since den. Milan I still bein' produced, hades still bein' produced. sincrap predict many time dat milan an' hades get crushed by amiga, no amiga appear, milan an' hades do well fer small companiy.

> >   sincrap reveal he have brain fart - jus' like when he call ati cards

answer question, sincrap - no excuse, we no play dodgeball. when will vapor cheap cube an faster g4 be released?

current milan have '060 option available. ya can buy milan wit' 060, it no vapor. dis is global economy, ya can buy via mail order.

>
> >   razor no call germany a rock. rock in sincrap's head.
>

hahahahaha! razor read much 'bout lousy service an' display at sears, mac user angry at idiot salesman. when razor go ta compusa on recent us trip, he not impressed wit' crapple section, it put in dark area. no employee on staff. very little softwrae. ya can see dust on imac. an' still, dere still many story I read 'bout mac users havin' ta make two hour trip ta buy imac. an' we all no what happen when sincrap brag when best buy become crapple dealer again, only ta have bb leave again. seems dey were right about worry dat imac wouldn' sell.

so, why crapple no get deal wit' company dat matter - like staples or business depot? like office depot?

sincrap want ta have tings handed ta him on silver plate. dose less whiny who like dere computer no afraid ta order by mail order.

> >   not if dey cant move dem. dat why crapple in deep yogurt now.
> >   sincrap
> > deny, jobs reveal, sincrap eat own spoor.
>

> ROFLMAO! on the Motley Fool..

as razor reveal, ya can' be laughin yer ass off when it so tightly
stuck ta head.

.You are a Fool and don't know it.

me know how smart I am - me no fool. sincrap play da fool, him big
laughin' stock. even crapple user who run inta sincrap call him cretin.

..MLynch
> gave us Don Regan....MLynch had to change their model to survive..Too
> stogy...

meryl lynch around long time. motley fool just bunch of idiot who run
web site. motley fool go down like other sincrap prediction...
>

     Quite. Something like the Mega would be a bit more
     appropriate. Unless you need a box with a lot of
     backplane cards, you don't really need anything larger.
     Even PC's are starting to get down to that sizse.

>                        b) RAM is cheap, start at 64Mb
>                        c) The ATI chipset is only average at best

               Plus, it is not openly documented. Something like
               the Matrox G400 or Voodoo 3/5 would be much better
               in this respect.

>                        d) Go with the industry standard, that being

That would be a tad expensive wouldn't it? Besides, you can barely get multiple CPU 500Mhz G4 systems these day. A better approach might be to use a higher degree of SMP with older and cheaper CPU's rather than going for something that would end up being absurdly expensive.

[deletia]

Bang for the buck in silicon quickly degrades once you start getting close to the bleeding edge. Case in point:

```
        Athlon  900: $220
        Athlon 1200: $575
```

--

A person is just about as big as the things that make them angry.

so sincrap think dat new amiga cause atari user ta jump ship? think differnt....

DAVID L. ORMAND wrote in message <8tna0r$r75$1@news.asu.edu>...

>('twould be cool if we could use THEIR hardware product for OUR new
>PPC-based Atari. Depends on how open it will be. Probably not enough.)

Depends on what you believe of their bull****.

Me, I'm not exactly sure this will be an amiga, or even an amiga clone. I'll have to wait and see, to tell the truth. WHat I've heard up to this point though, is far from encouraging. First off, there will be nearly zero transition from the old amiga, to the NG (this may have changed, still trying to sort through all the PR crap). Second, they insinuated before that hardware is unimportant, why try to make their own when there are plenty of macs and PCs out there already (sound familiar?).

In other words, they are too much a bunch of candy-assed faggots to do anything real. Third their "DigitalEnviroment" isn't even an OS in the traditional sense, but some bunch of PR-hype crap that isn't sure whether it wants to an emulator foundation, to run windows and MacOS off of, or a software package that emulates classic amiga on top of said operating systems. Fourth, while it's commendable that they are trying to off-the-shelf most of their reference platform parts, the specs lack any sort of 'soul' in my opinion.

My conclusion: If any platform has won this pissing contest, it is you guys and your atari. Both may be dead, but you got the last breath in, and you managed to use it to laugh at amiga. The company masquerading as

"Amiga" is just some loser tech company that saw venture capital dry up,
and decided to buy a name with the last of it.

John

sometime late next year, huh?

interesting - let's hope that, for once, this proposed Amiga actually comes out. The Amiga market has a history of being disappointed with promises made but never kept, especially the vapour fiascos by Escom and Gateway. And you thought the Milan II situation was bad!

>

   This is especially interesting because s*****p has been swearing up
and down in .advocacy that the new Amiga is going to thoroughly crush
the Atari market. Glad to have confirmation that right now the existance
of this new Amiga for sale is quite a long ways off.

   (oh, and by the way, if you want to see s*****p thoroughly sporked,
check out .advocacy now, he's being clobbered in the wake of Apple's
"speed bump", especially by TAF member John "Razor" Rikel. s*****p is in
full denial mode, much like Cartman when he took the Weight Gain 4000 :)
)

>

yeah. but Goodwill don't count.

does da fact dat dese are far from cuttin' edge technolgie (dey're
YEARS old), an' have NO SUPPORT from dere long-dead maker, an' ya can't
find parts fer dem when dey go under. truly, sincrap has finally gone
over da slimy pink wall when he has ta point ta "yesta-decade
technology" ta try ta make a point. especially when he call crapple
project from same period an' use same processor chip "junk".

You wanna talk expensive, you just TRY finding a modern Mac that costs
$5,000. Well, when the 8500/120 and 9500/120 were around, they COST that
much. And I bought them! If you think $1,500 is expensive for a Mac,
compare the price to what PowMacs used to cost a few years ago and you'll
see that Macs are downright CHEAP nowadays.

  The new "Amigas" will not be based on the old Amiga technology.
In fact, it looks like they may not even run Amiga software, as was
originally thought.

PuLeaZE....Your calling the Milan cutting edge technology? The current
Amiga's are indeed yesteryear technology but available over the border in
Wisconsin. Were can I look at the Hades in the states?

Those Macs certainly are 'cheap'. OTOH, similarly well put
together PC's are still less expensive.

You're wasting your time on sinclap. The only real viable alternative to a
PC is an Apple product, even you should be able to acknowledge that much.

Any other alternative platform is just a hobby hack, not that that is a bad
thing though.

I love messing about with my Amigas, but I ain't no fool either...

Regards,

Clockmeister.

No question of that, for the classic Amiga's in any case. It will be interesting to see if anything comes of this new Amiga project but I'm not holding my breath.

Regards,

Clockmeister.

sinclap,
just the way you answered my last post proves what i am saying.
you are what i say you are, and your answers are predictable.
i am not threatening you, i just need to know who would put up with
someone like you in the position that you say you are in.
i have seen bad management before, and you as a employee would fit that
bill.
you are wrong about your own time being your time, it all depends on
your behavior.
as far as losing the argument on the apple software, you cannot
understand what i am saying(further proof of what you are), i am saying
that i have seen it, just like many others have, and have not been that
impressed. that is a problem for apple, not atari, or any other
platform.
this is becoming a good exercise on how to try to reason with a
adolescent.

The truth is, boy, Apple is experience the difficulty as a direct result of the
Macworld announcements.. i.e., dual processor macs and the cube.

Nobody is buying the dual processor macs.. it was a huge mistake to release
them before a multiprocessor OS is available. Even the "evangelists" must

realize this.. people aren't going to upgrade their Macs until they know more about Apple's long term plan for multiprocessor support, and until they see progress with OSX.

The cube is interesting, but in real analysis, kind of stupid.. I don't see Imac users buying one, because it's more complex to set up.. and I don't see power users buying it because there's no slots! Mistake..

They should have expected there'd really be no way to pull things out until they can get faster G4 chips. People are not going to upgrade until either the OS offers true multiprocessor support or faster single processors.

Yes, Apple's problems are probably temporary.... but they do have problems... and I don't expect you to be honest enough to admit Apple's big mistakes this time around because you're an empty-headed Jobs cheerleader.

I disagree on the DP G4 sales...The DP G4's come with the photoshop plug
in that doubles the speed. A G4/500/DP with photoshop will give you
speeds upto 2 GHZ PIII speed.

The plugins are scarce, but the top tiers will support the DP.

as the header goes i talked to my first dealer friend today that agree's
with me.
apple has not got much software out there, people love games, they want
apple specific stuff.
he counted 144 customers last week at his both looking for iMAC specific
games, or software, and everyone of them cursed there kids for talking
them into a iMAC, when the parents wanted a PC.
does this sound familar atari dealers/users? you bet.
this will only get worse for apple, the need for software is now, the
hardware is already here.
apple cannot do this by themselves.
large companies will make there most popular applications for apple, but
its only there biggest sellers that they will do, and maybe just a
bloated bug ridden PC portovers, all of the other goodies that people
drool over also, but are not mega sellers will be PC only.
does this sound famlar atari dealers/users? you bet.
then once the market is so small that even the mega hits fizzle, bye bye
apple.
does this sound familar atari dealers/users, you bet.
the surest way for them to survive is for 2 other nitch motorolla
machines to thrive, thus getting all sorts of small software developers
who know the unique hardware coding.
jewels will surface, thus saving all, if not, so long apple.
he is doing a show this week, i may help out just to see a couple of
other dealers that i know, and to gage this first hand.
if i do work the show, and met the other dealers, i will post my
results.
thanks,
lance

You just don't get it! People aren't upgrading because most people don't get any real benefit out of MP machines right now.

Don't forget, you can't have it both ways.. Apple has been neglecting power Graphics/Video/Audio users for a long time, becoming a consumer computer company.. now the only people who can get any use out of the MP machines are power users?

Don't you see the obvious problem here?

> Sums up my opinion. Pricing and proper positioning will fix it..

Maybe, maybe not... I just don't see a market for that machine myself unless they come out with a PCI expander box. Come on, Apple SUBSTANCE please..

You know.. well, at least you SHOULD know.. that the biggest selling non-Imac right now is the old discontinued PCI models.

razor find dis - reaaly too funny. so pro keyboard work ok on PC, no work on older mac wit' usb. crapple claim it take til january ta fix. sincrap take sucker punch ta goolies - why mac no completely usb compliant dat dere own keyboard won' work on older mac wit' usb, includin' older imac? crapple coders dum as sincrap?

Apple reputation for hardware compatibility takes a nosedive

http://www.appleturns.com/#1

Keying with the enemy

Adding insult to injury is never a nice thing to do, even if the injury in question is really small. Did we say "small"? Make that "tiny." Personally, we never understood all the hubbub about how the four new keys on Apple's Pro Keyboard-- Volume Up, Volume Down, Mute, and Media Eject-- don't work on older Macs. Isn't something like that to be expected? In any event, some people made a big deal about it, including Apple. The company actually cancelled people's orders for the shiny new input device just because those four nifty-but-hardly-crucial keys were nonfunctional on all but the very latest Macs. Funny, we'd have thought that most people who ordered the Pro Keyboard did so to get a full set of standard keys, including a keypad and full-height cursor and function keys. Did anyone really buy one for the one-key Mute function?

In any case, here's where the "insult" part comes into play: according to MacWindows, if you hook up one of those Pro Keyboards to a USB-equipped PC running Windows 98 Second Edition, three of those four special keys work. Think about that for a second. Your Strawberry iMac DV? No go. That single-processor Power Mac G4/500 you bought in June? Out of luck. But plug your Pro Keyboard into some Dell or Compaq box which isn't even running the very latest operating system out of Redmond, and suddenly you can Volume Up, Volume Down, and Mute 'til your fingers bleed.

Dell has blamed Europe for the short fall.

I have not bought the stock yet. I am waiting for an $18 price. Maybe it
won't fall that low. But that is my price to acummulate.

I am looking at Earthlink now which is below $8 from a high of $30.

...as much as I hate agreeing with this raving lunatic, the
software scene for teh Macs isn't quite that dire. Plus,
those comments all sounded extraordinarily vague.

Besides, if you can afford to buy a Mac: getting another cheap
PC to just "be compatible" should actually be quite trivial.
Serious 3D gaming isn't cheap, but the rest pretty much is.

i actually visited a friend of mine that wholesales apple software, as
well as the PC. he only does direct sales a couple of times a year for
very large computer shows, otherwise its strictly wholesale to
dealers.his apple market has been shrinking dramatically this year, and
it does not look good.
he used to wholesale atari, and commodore software also, he dropped out
of them 10 years ago, and he said that the apple market know looks like
the atari/commodore markets 10 years ago.

he is very careful on what he buys as far as apple is concerned, he does
not want to take a bath in a liquidation type of scenario, like he did
with atari/commodore.
we both have been in the computer market so long, that we share the same
fears for apple, for we have seen this before.
no matter how fierce your loyalty is for apple, it will do no good
unless the motorolla style platforms expand.
you need good coders who know the architecture, not port over PC hacks.
thanks,
lance

jedi,
what i mean is real software written for the apple.
how can you win over customers with the same stuff as the PC?
if you use the same software, and it looks the same, and loads in the
same time, why not by the cheap PC that you say to do.
stop into any large software dealer, and browse the store for PC
software, its everywhere, and its cheap, now look for the apple stuff.
so run it on a apple with a emulator then, doh!
just buy the cheap PC!
atari/commodore users love there machines for certain specific
applications that work very well for them without the hassle of a PC,
other wise they would have moved on long ago.
i am not saying that there is nothing for apple, it is just so small
that its starting to resemble the atari/commodore market 10 yeas ago.
history is there for the looking, ignore it, and it bites.
thanks,

lance

Apples are remarkably better controlled and engineered
product. They always have been. Even on Zdnet you can
see a large number of complaints about how Win9x handles
USB. Whereas with NT5 you may be lucky if your USB device
even has an available driver.

This comes from being engineered from the ground up for end
users rather than being something slapped together to keep
Apple II's from getting to0 popular, that is then patched
over and over again but only done so in the absolute laziest
fashion possible while barely avoiding mass defections.

>if you use the same software, and it looks the same, and loads in the
>same time, why not by the cheap PC that you say to do.

Quite often with PC's you get what you pay for.

This is the voice of experience from the PC builder's trenches.

[deletia]

I don't bother with Windows anymore because of those sorts of problems. Were Apples more reasonably priced at the critical moment in time, I and quite a few others would have never even bothered with what are essentially "random collections of spare parts".

Being able to "run everything" ceases to be a compelling reason to bother with kludge klones after a time. You realize that you only need to "run enough" and that the mindless Lemmings don't tend to make exercizing free choice easy anyways.

jedi,
you seem to be missing the point, i am not attacking apple, i do not like the PC,
it is not a real computer, it is a calculator emulating a computer thru software.
but the lemmings that you point out to me need something more to push them over to apple.

i think the apple is a great machine, i like my sons G4. but you cannot
say to people that apple is superior"see there awesome architicure" when
it is running PC bloatware, or PC bloatware portovers, they do not
care, i know, i have sold computers for 17 years, people want software,
lots of it.
if your platform does not have what i want, and it takes alot to get it
to run, then why should i buy yours, when i can have theres with all of
the goodies.
you can tell me how great your stuff is, but where is the different
software(in abundance) that shows me.
i heard it from about 1989 till today.
you cannot change people, you cannot change history, you cannot call
them dumb(even if they are), the failure lies with the producers of the
platform.
remember power without the price, big deal, how about some software,
lots of it, really showing off the arcitictures.
thanks,
lance

You could argue that the selection and variety of Apple software on
display at retail store fronts has been dismal for more than ten years in
comparison to the wintel selection. There are areas of improvement.

However, CompUSA as a nationwide chain has the best selection of Mac
software, plus many hybrid titles.. Installing a game on a mac is far
superior than installing one on a PC due to the undescipline of the PC
organ bank due to compatibility issues.

There will be a new super computer store thats having a grand opening this
weekend in mn called Micro Center. Look for the ad circular in the Star
Tribune. They have the Apple show room dept with the wide assortment of
Apple software on display. Even have Web Objects and FCP..

i will look for that in sundays paper.
comp u.s.a. has a fine apple selection, i agree.
but the real problem is you need that in many stores, not just one chain.
i was in best buy yesterday, apple stuff was very dismal.
when apple gets this stuff out into many store fronts it will look better for there survival.
right now its a nitch item for some stores.
most people will only buy stuff thats widely availible.
apple has the hardware base already, what they really need is to bolster software, hardware sales will follow.
its like swimming up stream selling non PC hardware with a lack of software, or outlets that sell it, i know, i have done it for 17 years.
i got so fed up, that i decided to produce my own.
thanks,
lance

True, but with the advent of a new store that has a Apple show room will
improve the selection variety in mn. The ad circular for the grand
opening came out on Thursday I believe. There was a full page on Friday
in the Star Tribune as well.

Let's see.. I know about 15 people who work for Apple including two people on my
hockey team, their headquarters are ten minutes from me, I've even interviewed
there.

Now.. you can be "closer to the scene" if you want to. All I know is, the people
I
know who work at Apple pretty much agree with me, and recognize the problem..
except for one gentlemen who is a "true believer evangelist." The rest are
regular
people.

There's an interview with the Utah Saints up on http://www.icrunch.com at the moment and among other things, the Utahs talk about why they've stuck with Atari computers at the heart of their music studio. Quite interesting reading.

"Power To The Beats", the damn heavy new Utah Saints record with a sample of "Enter Sandman" by Metallica plus a guest vocal by Chuck D of Public Enemy, was released yesterday (October 9th) in the UK. As well as being available on CD and 12", it's also available for "digital download" from www.icrunch.com- worth a listen.

Stuart.

Yes, the stock crashed. I view it as a buying opportunity because the stock is cheap compared to their strong fundementals. The company has a strong balance sheet with $3.8 billion in cash and just $300 million in longterm debt. The current market cap is around $7.3 billion. Apple could use it's cash to buy back half it's stock if it wanted to do. The stock has bottomed at $21 which is $3 more than I wanted it to be take advantage of my greed windfall..

Hey Razor,

thats pretty ingenious using one pompous blowhard loser to deflate another. Too bad Dereks powerpc emulator is shelved. but I'm not surprised in his 13 years of writing emulators he never did produce one that worked. Thats right the first version of xformer was an apple II emulator he tried to peddle to computes atari mag which they rightly refused to publish. Not that I blame them, it contained pirated OS roms from apple, and on the few occasions it actually ran it turned an 8mhz ST into a 0.25mhz apple II, when a real apple ran at 2mhz minimum. Don't be foolled by Dereks bollocks though, his emulator of powerpcs is shelved for only one reason. He's a lousy programmer, and simply can't produce an emulator that can't even meet his own low standards.

The only point is your anecdote is no more "valid" than mine.. and thus, you are
no
"closer" to it than I am.

You have been in denial over this for a long time, and have consistently shown
your
lack of understanding of Apple's key markets. No offense, but I think you're
wrong
here too.

Pretending Apple doesn't have problems won't make them go away. Smart people
address those problems instead of ignoring them. You can't address the problem
until you admit there is one. Apple's numbers PROOVE there is one. You can crow
all you want about Dell's numbers, or whoever else's numbers, but the fact remains
that the quarter where Apple releases new models has usually meant pretty good
numbers from them in recent history.. get the point? The market may be down, but
Apple's current problems are deeper than the market.

Releasing a multiprocessor computer without having an OS ready? Silly..

Besides, Apple got people all hot and bothered about multiprocessing before with
the
9500/180MP.. and how many apps actually took advantage of that 2nd processor?
Once
bitten, twice shy, buddy..

an' even worse - AMD just release their numbers. AMD make profit, BIG profit. now we kno why intel do bad.

intel an' dell say their problem in Europe market. crapple problem go deeper, dey have problem all over globe wit sales. companies who claim ta have $5 bill in bank don't put on hiring freeze an' cancel projects. sincrap go deeper an' deeper inta his rdf world ta escape da reality dat crapple is goin' down, an' it's dere all fault fer bad decisions, too many lies an' stabbin' dere loyal users in da back ('member da trojan horse dey put in da G3 tower firm ware update dat made it impossible ta install G4 - dey even admit it).

crapple go below $20 yesterday - sincrap already losin' dough. razor get better return in bank wit' term deposit, an' it insured if bank go down by government.

>
> Releasing a multiprocessor computer without having an OS ready? Silly..

me read friend Chris' copy of latest macAddict - laugh at dere review of DP G4. Dey honest ta admit dat 2nd g4 is deadweight an' only make little difference in photo shop. so much for sincrap claim dat 2/G4 twice as fast as vapor 2gigHZ PC.

Are we talking about Apple's G4 sales or missing their financial target?
Apple has stated that the shortfall is due to the G4 Cube(I have issues
with it too) and not meeting their education numbers. One could argue
that the missed targets are due to shipping the products late in the
quarter. Apple did not ship their new iBooks and the $799 iMac 350 until
well into September which may have been to late to drive revenues.

So, Apple's multiprocessor G4 caused their shortfall?

> Besides, Apple got people all hot and bothered about multiprocessing

processor? Once

> bitten, twice shy, buddy..

So adding a second processor, GB ethernet and bumping up the HD for the
same price as the previous line is a problem? Granted that only a handful
of products takes advantage of the second processor is not the cause of
the sales shortfall. Apple publicly blamed the G4 Cube which did not ship
into volume until September.

We're talking about both.. I know what they said, and yes the Cube is responsible
for part of it.

> So, Apple's multiprocessor G4 caused their shortfall?

Contributed to it significantly, yes. Upgraders didn't bite for the most part..
and
neither have new Mac users.

> into volume until September.

You're missing the obvious here.. it might have been the same prices, but sales numbers didn't increase much at those same pricing the way they would have had Apple been able to deliver a 700mhz G4. Nobody cares about GB ethernet, at least not yet.

Again, people didn't bite on the Cube, but also people just aren't all that excited about dual processor machines where that 2nd processor is mostly idle.. it's not hard to understand why.

Once OSX comes out, if it's stable and utilizes that 2nd processor for OS level operations, THEN multiprocessing makes sense and probably WILL help drive sales. Not yet...

I'm still a bit annoyed at Apple for neglecting pro audio/video/multimedia users for so long by not giving us six slots. They've lost a lot of ground they used to OWN in the process. With a couple of exceptions, USB still isn't generally as good as serial for MIDI. Now, firewire audio cards have been announced (not shipping for several months), so maybe, once we find out how well they work, the point is SOMEWHAT moot... but damage has been done. The question I have is not whether they can get people back.. they can get SOME or even MOST people back is my guess.. the question is whether or not Apple CARES to even try. I hope they'll make an effort to display their commitment to the NON consumer market.

The only thing I did not like about Derek was the way he cut down the Atari ST, yet he expected to make a living selling an emulator of it.

Excuse me...Apple will have a $500 plus sales/revenue gain in Q4/2000 over
Q4/99. What has tanked?

>   real truth is crapple no no how ta market. gateway, dey just also
> announce big bucks in quarter. dey kno howta market, dey kno market.

GateWay announced 4150 million in earnings. Apple will come around at
$110 million before special gains...Sounds like you failed
financial/investment planning..

>
> > It's getting close to my price target.

Highlight....

We ask for your understanding for the fact that we decided us not to produce an outdated hardware standard in the long run but the expenditure on capital assets amounts to some million German Marks.

sinclap spin: Oh duh!

Hi all,

here you are:

"Kiel, the 10,10,2000

statement to the Milan II

Weeks and months it was quite calm almost around the Milan II. Last large appearance and associated, official messages took place on the Atari fair in June in Neuss.

Meanwhile many Milan fans are however in unrest guessed/advised, because they do not receive acknowledgements for the well-known erscheinungstermine of the Milan. Long time lasted it, until we could take position from the company Milan officially for current situation.
However the reason is that we did not want to publish wrong information, up to the day of yesterday (09.10.2000) no unique decision had met.

The Milan II

The targets of the Milan system were clearly outlined: It had a new board Design on base of the Milan I ago, which continues proven items in addition, brings substantial improvements with itself. So e.g. a AGP port or also the support of SDRAMs.

In the spring this yearly was again revised when desired the selling partner, which always transmitted an estimation market chances of the Milan to the computer enterprise, the concept. In order to go to any dependencies on driver manufacturers for diagram cards and sound cards out of the way and besides the Milan II in a compact housing to under-get be able, became decided, to integrate the components for diagram and sound on the Motherboard.

A first prototype of the Milan 060 was to be seen on the fair in Neuss.

Against expecting technical problems in-crept again and again, for whose purpose even additional hardware designers were engaged.
The integration in particular the AGP port, in addition, the SDRAMs prepared hardware-technically under-waited difficulties, which could be solved however after viscous advancing in the late summer 2000. Just in this moment occurred what had to occur:

The manufacturer one of the two important log IC chips of the Milan (he takes over the complete emulation of the not existing Atari hardware) was adjusted despite contrary promises on the part of the manufacturer and is available neither in smaller numbers of items than remainder nor in large numbers of items than special production.

A shock for the Milan team, because a scarce year work was in this chip. An adequate, counterpart existed at the market, which can be adapted fast, dezeit not or could not be found yet.

Together with the selling company AXRO the situation in the late summer 2000 was discussed. Together with our distribution and interlocutor it came to the result that a small computer company, which does not manufacture quantities in hundred-out one hundred and abverkauft this problem could flower on a long-term basis again and again. And first considerations for adjustment the project were discussed in addition, put fast again ad acta!

The new OS

In this moment a project was drawn from the developer drawer, which Uwe cutter, Ali Goukassian, Michael rockers and Thomas Goettsch had already prepared in November 1999 and had conceptionally held. It should be implemented actually only in one of the future stages of hardware production, in order to save time.

The speech is from a new operating system concept, which almost hardware independent a Atari TOS or a MagiC Milan could make thereby.

The new Milan OS, which differs technically far from the Atari TOS, because many areas of programming were structured new, is simply expressed structured as follows:

It consists of a depending on hardware and an independent layer. This step had to be carried out, in order to bring Atari programs on the new Milan hardware to running.

While the independent layer takes up the instruction e.g. for the access to sound, diagram or fixed disk, this instruction is interpreted and the depending on hardware layer, which transfers the actual access then transferred.

Thus it should be ensured that easy modifications in the hardware (Milan I - > Milan II) at few expenditure to be adapted can.

MagiC Milan again was changed so much opposite the standard designs the fact that it does not make any own access more on the Milan hardware but transfers its �Wuensche " to the hardware to the Milan TOS. This step made the MagiC Millan development again independent of the Milan hardware.

The new operating system concept designates now a step, which was already initiated in similar courses by Apple with the new MacOS X or by Amiga Inc. for the new Betriebssytem (project name Elate):

Depending on hardware sections of the operating system Milan TOS by our developers against a Linux core one exchanges at present. This part of the operating system is not under any circumstances Atari typsch, but serves excluding the interpretation of the hardware accesses on the part of the operating system or the software.

Linux, a Unix derivative, is Freeware and by hundred-from one hundred of programmers is as well known developed further.

And Linux is today so far established that drivers for the access to USB interfaces, fixed disks, are Firewire interfaces, network cards etc. always briefly after appearance of the respective hardware or hardware standard available.

For the Milan crew it had meant in the past to develop drivers e.g. at all for responding the Milan USB port.

Owing to the new concept the Linux core is embodied however with the independent part of the Milan TOS. Places the Milan TOS or the software, which runs under it, a request of an interface, this is transferred over a standardized interpreter to the Linux core, which is at the edge mentioned also only a few KB large. This again already has all necessary drivers, which are world-wide freely available, in order to tie up any modern hardware (- standard) to the TOS.

Perspectives

The perspectives look today on the one hand well, on the other hand disappointing: The Milan II was put on ice. Months-long work, which swallowed thousands of D-mark is likewise triumphs, like the hope of many Atari users to be able to call a fast Milan II already soon their own. This is to be charged primarily to technical problems. In addition, beyond that the months-long is tried to also draw venture Capital societies (holding companies) from Germany in the boat in order to supplement the capital clearly, failed. In this country ones become at present primarily InterNet air things, which do not create anything within shortest time from that a fictitious million-value, which falls mostly however evenly so fast again into the depths, supported and from the baptism elevated. One that really few enterprises, which has to offer computer know-how and its own, small and operating system equipped with much software, however unfortunately saves the large risk, costs for the investors by materials production (Main board etc..) to cause.

But this means the end of the project with nieces. Milan computer system will offer, to all that, which would like today a Milan further the Milan I with 040er-Prozessor. And also the Upgrade card on the 060-Prozessor are to be had further and meanwhile. In fact at present thus nothing stands to the possession of a Milan with 060-Prozessor in the way.

The step, which is now done, is to be looked toward Milan III. And but at present two scenarios are to the selection, which build all together on the fact that the Milan TOS (and thus the essay MagiC Milan) already soon it is almost hardware independent could:

a. One decides for an Linux core adjustment on e.g. AMD hardware (Athlon, Duron) and standard board peripheral device. In the course its is selected a board, which imports only in this country be acquired must. Conditions are fulfilled like a large Flash EPROM. This can be still a TOS based computer, which starts directly from the chip. The arithmetic performance would grow with this solution proportionally to the assigned processor and with a 400MHz-Chip the performance of a 060-Prozessors very far would already exceed.
b. One begins (if necessary own) a PPC G3/G4-Board, which is still closer to the 68060-Prozessor, so that starting from 350 MHz more than one doubling of the arithmetic performance was achieved here.

So that the TOS runs also under these processors, a 68k-Interpreter is integrated, which runs differently than Windows or MacOS based emulation, independently natively and a high arithmetic performance enabled.

For version b) a license partner was opened at present, which would sell 2001 maximummodern G3-PPC-Boards toward start to manufacture and as OEM product at Milan. Here it would be ensured that the computer altogether approximately 1700, - DM would cost. The negotiations run at present. The partner would not like to be called before contract drawing. Clear it is however that specifications were likewise kept such as diagram and sound on a min in OTHER board, like now even the binding of a network adapter and a bus clock of 100MHz.

The perspectives, which would offer one from the NOT already promptly transferred to implementing, are enormous:

The entire operating system will be still smaller approximately 2 MT and could be operated on processors such as AMD, Intel, PPC in addition, RISC, Aplha and Thosiba at a comparatively small expenditure.

Thus the Milan TOS with MagiC Milan becomes in nu one of the smallest, portable operating systems, with which the software (differently than e.g. with Windows CE) does not have again to be compiled, in order to run on different processors.

First versions of this new operating system symbiosis already had to be seen in October.

Result

Their confidence, dear customers, surely shrank in the course of the time, because you had to wait for a long time for an not appearing device. But a reproach, which one cannot make for Milan of computer system is that that in this house the things were not finished. Because as only manufacturers Milan of computer system succeeded in bringing an executable 040/060-Computer to the price eligible for financing in circulation. With this step Milan succeeded in proving that here uncoordinated technique Freaks at working is not only, but that concepts and clear lines can be transferred also up to ready for the market ones.

Herein the enterprise differs from numerous companies, which let intelligent and talentierte headings operate senselessly for many years, without supplying results.

The Linux core idea, which trusted to transfer itself the team not promptly to be in order not to stop the Milan II according to schedule, seems the only load-carrying solution. It nevertheless gave always considers, whether could succeed, a 80MHz-Computer to intersperse and also whether it would be enough to use a main processor become outdated technologically hopelessly as the 68060.

These concerns are extinguished with an impact. The Milan could live on already soon on efficient platforms and let the operating system on competitive hardware, loved by us, continue.

In particular the perspective to receive G3/G4-Boards wakes nevertheless many hopes, because such a computer would not only underline the breath of the non-standard one - it would arouse world-wide much interest.

And this way seems also economical to be more lucrative, because nevertheless now no hardware production connected with high risks must be carried. The developers can itself on an area - the operating system - concentrate. And so it is only one question of the time, until the new Milan III can be on our desks.

Realistic estimates to the consequence this �t until 2nd quarter 2001 the case could be. But as said: Then as super modern hardware.

And up to then there are the Milan I - 060 for all those, which would not like to do already today without speed.

We ask for your understanding for the fact that we decided us not to produce an outdated hardware standard in the long run but the expenditure on capital assets amounts to some million German Marks. And even if you, dear Atari fans and we know that 80MHz are sufficient, in order Atari software with highest speed to operate - one will be able to put this not close to the mass of the computer people.

If one intersperses the Milan TOS (project name TOS 6) in the future however as �Easy Computing Environment " - thus a working environment for simple computers which can be served -, in which it runs on some platforms. Additionally now also still another its own reference hardware on base of a non-standard power PC system offers, then one has a real chance by the world public of the computer-interested users and media to be considered. We could learn that in the course of the passed months.

In the future we will inform you - there we now the route of march of the Milan know - again regularly about the events both in the InterNet and about the publications.

Its Ali Goukassian and the Milan team "

Bob King.

OS X will likely drive more sales. Again, Apple's shortfall is blamed on
the G4 Cube and education.

Like major QC/QA issues, sorry about that long reference

http://news.cnet.com/news/0-1006-220-3165744.html?tag=st.ne.ni.ucwytnav.wytfm#3176197http://news.cnet.com/news/0-1006-220-3165744.html?tag=st.ne.ni.ucwytnav.wytfm#3176197

Giving up on the Cube..

Well, after 15 years of loyalty to Apple, I've finally succumbed and
bought a Wintel box. Just two weeks ago I bought the Cube. The next day
it was returned because it would spontaneously turn itself off and start

on/off cycling (I see that others have reported this problem as well). I received a new Cube and 1 week and countless hours trying to figure out why I couldn't connect using my DSL connection, I verified that the Ethernet card was bad. Of course, you can't just replace the Ethernet card in the Cube because it resides on the motherboard. This was the last straw. For years I've been a Mac evangelist. I love the way Apple is on the forefront with new designs and technology. However, I'm tired of being a Mac person in a Wintel world. I'm tired of always having to think of a "work around" to be compatible with the majority. I'm tired of hearing about software that could improve my productivity only being available for Windows. In short, I need to get my work done and not have to worry about random problems and compatibility issues! I hate not having reliable tech support and service to deal with problems should they arise. If the problems with the Cube had popped up months from now, my only recourse would have been to ship the Cube to Apple for repairs and be down for God knows how long.

So...I returned the Cube and purchased my very first Wintel box. On the one hand, I'm very sad that, for the first time in 15 years, I no longer own a Mac. On the other, I'm relieved and excited to know that I'm fully compatible with the majority of the users out there, as well as my platform at work. I certainly am not passing judgement on the loyal Mac crowd out there. Its just that, for me, I was wasting too much time trying to work on the Mac platform.

Sports Fans...

So...Were is the Milan II? Did not the Jihads jump up and down with drool tantrum.. promise that the underpowered non competitve beige box would be out by now? What gives? In the mean time, a 68K/Pentium crushing PowerPC G3/350 indigo iMac is out at $799 in quantity worldwide. Don't forget the G4 Cube..

sinclap!

Hi Mark

Just to let you know that it's nearly as bad here. Got 6 extra channels
on my digital tv just for the olympics + 16 hours a day on the major
channel. Enough sports for anyone :-)

Hi Mark,

Why do I get this image of you in a bikini jumping up and down on the
beach and grinning inanely at the TV camera, or do you just intend to be
in the audience?

I understand there's a lot of it about in Australia.

Bob King

Ahhhh, but I am a Kiwi. Besides I live in Melbourne, it is the Sydney siders
that are strange:-). Well truthfully most Aussies are weird....

Mark

There are more Kiwi's living in Australia then there are in NZ I reckon.
There is _something_ they like about this strange land, like our job
oppertunities for instance.

Regards,

Clockmeister.

Tired of all dat crap dat phony Apple salesapologist Sinclap's been shovellin' down Atari users throats all summer? Well, a long-time poisson in the Atari world has some very interestin' things to say about processor speeds and bloated, buggy operatin' systems like Windows ME and Apple's seven-years-too-late OSuX - and how both companies bamboozle yas into thinkin' old computers are useless and junk.

Oh, yeah, and for all dose here who moan, "what's dis have ta do with Atari Computers?". Keeps readins, mine fronds, 'cause he mentions Atari and dere users in the missive......

Come to our booth at Comdex and you won't be disappointed. But let's cut through the marketing hype. The following is an open letter to all Emulators customers and Macintosh users from Emulators company founder Darek Mihocka. The original letter posted on September 15 is immediately below. Part 2 posted on September 21 and 23 is below it.

September 15 2000

Since our demo at Macworld Expo in New York this past July, we've been getting inquiries about when exactly we'll be releasing SoftMac Professional, the Power Macintosh emulator that was demoed at that show, and when we'll be supporting Mac OS X. I would like to answer those question right now - NOT ANYTIME SOON! Please don't send yet another email asking when. We will show our Power Macintosh emulator again at COMDEX as mentioned above, and in January we'll be returning to MACWORLD San Francisco again to demonstrate it there. As of today, we do not have a release date set, and we are shelving further development on the whole SoftMac Professional PowerPC product until next summer.

I would like to clear up some confusion and rumors and respond to a number of general questions we've received by email. Is Emulators Inc closing down? Not at all. As I will explain, we are putting work on PowerPC emulation on the back burner right now and focusing on other products and technologies for the foreseeable future. PowerPC emulation is a nice idea, a pretty cool idea in an ideal world, but from a business point of view the time is not right, and the whole Mac OS X thing just goes against everything my company stands for. The Power Mac emulator is not a product that fits our goals right now.

Emulators is in business to make emulators. I personally have been developing emulators for over 14 years now and have always believed in the concept of one computer that "runs it all". This nonsense about "my computer is better than your computer" that raged through the 80's and still lives on today is just counter productive and wasteful. In reality, let's face it, all the people that build and design computers came from the same engineering schools, learned the same technology, and pretty much build the same computers. An Apple Power Macintosh G4 and an Intel Pentium III based computer really have far more in common than most people would like to admit. That's what makes emulation plausible - an emulator simply does some translation of one type of computer code to another in order to make machine A run software written for machine B. I believed in this concept 14 years when most people said it couldn't even be done, and I see today emulation is highly popular, with products such as Soft Windows and Virtual PC and of course our own Fusion and SoftMac 2000, and with major operating system such as Windows and Mac OS 9 using emulation to run older software. Most people don't realize that without emulation Windows 98 and Mac OS 9 would grind to a halt since most of the code they run is actually legacy code written for older operating systems.

So it's with some enthusiasm that about a year ago we embarked on the major task of developing a PowerPC emulator to run new versions of Mac OS on the PC, including the upcoming Mac OS X. Unfortunately we fell victim to our own hype and other people's hype, believing Microsoft about the capabilities and schedules for new versions of Windows, believing Apple's claims about Mac OS X being available this summer, and believing AMD's and Intel's claims about new gigahertz class processors. We got the PowerPC emulation working in the lab this spring, it worked as expected, and we planned to ship a product later this year. But we fell for too much hype from the other guys without really paying attention to what customers were asking for and thinking about what really made sense.

As anyone who reads the news knows, it's been a busy month so far for hardware and software. Intel was set to release their gigahertz Pentium III but had to recall the product due to the fact that the chip, well, didn't work! Oops. The Pentium 4, the first major change in Intel's processor architecture in over 5 years, well, that's a bit behind too now. Anyone who has read the current issue of Popular Science magazine has likely seen the article about the Pentium 4. It says by the time you read the article the chip will be out. Oops! AMD, well, they make great chips, excellent chips that we highly recommend, but their capacity alone can't fill the void in the high end chip market right now. Intel's Itanium chip, the new 64-bit processor replacing the Pentium line, is years behind schedule and has now been pushed out into late next year.

The availability of these chips is crucial to making a real-time G3/G4 emulator work well. While 68000 and 68040 emulation may work beautifully on 100 MHz to 500 MHz class PCs, emulating PowerPC chips, simply due to the nature of the much faster clock speeds of the PowerPC chips compared to 68040 chips, requires faster PCs. All the hype from Intel and AMD about low cost gigahertz class machines being on our desktops today just hasn't panned out. Sure, as a company with deep pockets, we can afford to buy the rare few machines and blow $6000 a pop on Windows 2000 machines to demonstrate our product on at computer shows, but this is not realistic as far as our customers go. Most of you are not running 600 800 1000 MHz class machines, you're running 200 300 400 MHz Windows 95 and Windows 98 machines. We can put on a great demo of our product at Macworld for you, but is this the experience many of you will have at home on your PC? No. As many of us that have run certain emulators know, a slow emulator is next to useless. Who hasn't run a PC emulator on a Mac only to be disappointed by the excruciatingly slow performance? This is not acceptable to us and is not the kind of emulator we want to market. While we take great care to hand code our emulators in assembly language, not C++ or some other bloated language, there are still limits to how fast an emulator can be. Obviously a 200 MHz PC can't hope to match the speed of a G4 under any circumstance.

We all have to stop and realize something, a point I keep reminding people of when they email me and ask about PowerPC emulation. The kind of customers looking to upgrade from an old Mac to a PC and who buys our 68040 emulator products is not the same kind of customer who'll be looking to run Mac OS X on a G4 emulator. It's two entirely different markets consisting of two entirely different kinds of computer users. For most of the past 14 years our products have catered to the first kind of customer - someone with an older computer, say a Mac Classic or a Mac II, looking to upgrade to a new computer, say a Pentium running Windows 95, and who wants to just make that old software run. This kind of user is on a fixed budget, who isn't interested in throwing away 10 years worth of old software that they love and enjoy, and who can't afford to buy new every year. This is the kind of customer that got our business started in the first place. Atari users who couldn't afford $1000, $2000, $3000 hardware upgrades to soup up their old Atari ST computers, who instead chose the PC route and used our low cost Atari emulator (Gemulator) to get the speed and performance they were looking for.

The other type of user, the "cutting edge power user" for lack of a better term, to them money is no object, buying a new computer every year is no object, buying new software every year is no object, and just plain being a victim of marketing hype is a way of life. This is the kind of person who buys a fancy race car or a translucent computer without thinking about functionality and practicality. This is the kind of person who will run out and buy Mac OS X for the sake of running Mac OS X without knowing anything about it or knowing why they're buying it. And I have come to the conclusion that we really do not wish to market to this type of brainless individual. A school on a fixed budget looking to upgrade their computer hardware is not going to make such rash purchases. We've sold to a lot of schools, we know what their needs are, and having the latest bleeding edge technology is not it.

The other big pieces of news this week were on the OS front. Microsoft made the long anticipated release of Windows Millennium, the successor to Windows 98, which I actually got pretty fond of as being a somewhat stable release of the 16-bit line of Windows 9x. I still prefer NT (and now Windows 2000), but for the average PC user, Windows 98 isn't too bad. We've received the final release of Windows Millennium, and discovered one major problem with it already that didn't show up in the beta releases, one that under certain situations can make Windows Millennium considerably slower than Windows 98. And it affects our product which means our development will get side tracked again, as it did with the Windows 2000 release, to work around Microsoft's bugs. I personally can't recommend going out and buying it right now. Stick with Windows 98, or for Pete's sake, if your PC runs at more than 200 MHz and has more than 32 megabytes of RAM, saveyourself the misery and simply upgrade to a 32-bit release of Windows such as NT 4.0 or Windows 2000. If you have a 486 or slow Pentium or have 32 meg or less, then of course stick with Windows 98, that's the kind of machine Windows 95 and 98 are designed for. But not for your Athlon or Pentium III.

Not to be outdone, Apple finally made the long awaited release of the Mac OS X public beta. Many months too late, several months after the rumored free public release at Macworld Expo New York that never happened. Seattle was the North American launching ground of the Mac OS X beta, with several Apple sponsored demos held here in town this week. I attended and looked at Mac OS X and played around with it and also watched other people play around with it. I have to say I am extremely disappointed with both Mac OS X and in the way that Apple is handling it.

Congratulations Apple, you will finally (next year?) offer the same OS technology that Linux and even Windows users have enjoyed for years. Real multitasking. Ooooh. To this day, even Mac OS 9.0.4 is based on a 2 decade old OS technology which is why even today, it isn't very difficult to lock up or crash a Mac and why Apple has to keep putting disclaimers on their software to not use it for critical applications. But Mac OS X is really an entirely new operating system. It isn't just yet another Mac OS upgrade, it's as drastic a step as moving over to Windows NT or to Linux. Completely new user interface, new kernel, limited backward compatibility, and hardware requirements that will put it out of the range of the great majority of today's Mac users. This is not right and watching this week's demos, the more I learned about Apple's future plans the more disgusted I got. This is in fact "the straw the broke the camel's back" and the reason for this letter.

Why can't we all just download the Mac OS X public beta. We each have to shell out $25 to Apple to even get it. That sucks. That's considered "public"? A $25 down payment towards the purchase of a 7 year late OS? As one Apple engineer explained to me this morning, Apple needs to cover their development costs and having people pay for the beta is just such a way. This is a page straight out of Microsoft's playbook. Perhaps it's the money Microsoft injected into Apple 3 years ago, perhaps it's Apple's greed from the 80's, who knows, but I find it sickening that Apple is choosing to force people to pay $25 to have the "privilege" of beta testing a piece of software that now from their own documentation looks as it may not even be ready until 2001. On top of that, as we're finding out the specs on Mac OS X, we find that Apple is pulling yet another planned obsolescence stunt and essentially obsolescing all Macintosh computers more than 2 years old.

Let's think back Macintosh users. Remember good old System 7.0 and 7.5? Those operating systems ran on anything. Whether you had an original 1984 Macintosh Plus or a (then) new 1995 Macintosh Quadra or Power Macintosh machine, one operating system ran on just about every Macintosh ever released. Such a standard OS made it easy for users, made it easy for developers, made it a snap to configure and set up a machine. Apple even licensed their technology to other hardware manufacturers and allowed them to make Mac clones. This was a very smart thing to do.

Then Apple took a wrong turn in 1997. Low on money, they made a deal with the devil (Microsoft) and did two things. They revoked their licensing to other vendors, forcing Mac users to once again buy the slower more expensive Apple computers instead of better clones from Power Computing, UMAX, and others. Then they also cut off about 50 million users in one fell swoop by releasing Mac OS 8, no, not the Rhapsody/X Mac OS 8, but the "Mac OS 7.7 renumbered to 8.0" Mac OS 8.0. In that step, they raised hardware requirements steeply, cutting off all 68000 68020 and 68030 based machines, and even some 68040 machines. Basically, if you bought a machine before about 1995, you were out of luck. Either upgrade or become obsolete! Microsoft and Apple stopped supporting the older machines, as did other major software vendors. You want to run the latest Photoshop? Throw away your $5000 Quadra 950 and buy a $5000 Power Mac was the attitude.

Mac users did one of two things at that point - they bit the bullet and shelled out a huge amount of money on new machines, the new Mac OS 8, and new software. The others, well, they had enough and switched to PCs. Schools did it, businesses did it, ordinary fed up home users did it. In fact, this mass exodus in 1997 which was well documented in the press is what prompted my company to begin work on Macintosh emulation for Windows. Until then, we made Atari game emulators. But with tens of millions of Mac users now being told "you're obsolete, buy new hardware", we saw a market that sure enough developed and has kept us in business for the past 3 years.

Apple is doing it again. By raising the bar so high - you need a minimum of a 128 megabyte G3 or G4 based Mac just to run Mac OS X - that they are making obsolete every single Macintosh over 2 years, and even some newer machines. This action is just plain disgusting. People who bought machines just a couple years ago in anticipation on this new OS now find they're holding useless hardware. If you think your 300 MHz PowerPC 604 machine that you bought in 1998 makes it, forget it. You're cut off. In talking to Apple reps today I learned that the 128 megabyte limit is a bare bones minimum that even they don't recommend. 192 megabytes is the practical minimum. That's beyond the memory capacity of even some of the original iMacs sold only two years ago.

Backward compatibility? Well, you can split your hard disk into two volumes and dual boot, or you can run Mac OS 9 in "classic" (i.e. emulation) mode and watch your existing Mac apps run slower. Mac OS 8.6 and earlier are not even supported in emulation, leading me to wonder how compatible the "classic" mode even is. Apple just doesn't GET IT! Even Microsoft, the evil empire, and trust me, those who know me know that I am not fan of them, even Microsoft does not pull stunts like this. The Windows NT 4.0 and Windows 98 that you can still buy today for your Pentium III will still run on your 10 year old 486. We do this ourselves here in the test lab. We run NT 4.0 on a 33 MHz 486 with 16 meg of memory. And guess what? It runs. It works. We even run Windows 95 on an 8 meg 386/20. No reason to throw away old equipment if it still runs today's software.

The beauty of PCs, and why I feel Windows ultimately won out over Mac OS in the mass market despite sleazy underhanded marketing by both Apple and Microsoft, is that PCs don't go obsolete every 2 years! Any given PC can run a wide range of DOS and Windows releases. And similarly a given OS runs on a large variety of machines. Windows 95 runs on the slowest 386 (a 14 year old computer now!) to the fastest AMD Athlon. DOS, good old MS-DOS, has run on every PC over the past 20 years. This great backward compatibility is what has made PCs the standard computer.

This is why for the past 5 years my company has produced emulators for the PC platform. Because the whole point of emulation is to run software from different computers on a common platform and we don't want that platform to change on us or our users every 2 or 3 years. If Microsoft came out with new operating systems every two years that required us to rewrite our code or lose a large percentage of our customer base, we wouldn't be happy. If Dell or Compaq or Gateway suddenly decided their new machines won't run DOS or Windows 95 or NT and require only the latest version of Windows, we wouldn't buy those machines. Yet this is exactly what happens time and time again in the Apple world. And people leave and the Mac market shrinks. They use some fancy advertising to win people back. And then they screw them over again and people leave again. Like I said, Apple just doesn't get it! Just as most people don't buy a new car every 2 years (the average car on American roads today is about 8 years old), real people just don't buy new computers every 2 years.

After seeing Mac OS X and seeing Apple repeat its 1997 strategy, I predict a mass exodus of Mac users as a result of the arrogant and irresponsible policy Apple has created for Mac OS X. Poor backward compatibility for old apps. Requiring hundreds of dollars of memory upgrades and possibly even processor upgrades. Added to the insult of having to pay to beta test.

So I've had to seriously think, why do we want to support this in our emulators? With a 192 megabyte memory minimum, with overhead from Windows and the emulator itself, a reasonable PC would require 256 megabytes of memory and a gigahertz processor to run Mac OS X. Such PCs are extremely rare right now and our average customer does not own anywhere near that. For 14 years, our emulators have always been hand coded in assembly to be small, tight, and fast on the lowest end machines. To now develop a product that is only useful to the top 1% of Mac or PC users, well, that's not good business sense or even interesting for that matter. That's not the original mission of our products and we aren't going to waste our resources catering to a small minority of computer users at this time or forcing our existing customers to upgrade their hardware.

So as I stated, our PowerPC project at this time is being shelved indefinitely until such time as Apple ships Mac OS X, gigahertz Intel and AMD processors are commonplace and inexpensive, we stop having to work around bugs in Windows, and people convince me it's worth pursuing. We've got most of the technology finished, we've shown it, but from a marketing point of view, selling people a fantasy makes no sense.

Our philosophy is to develop products that as many people can use as inexpensively as possible. That's why every emulator we've released in the past few years still has to pass the "486 test". Does it run on Darek's old 33 MHz Dell 486? Does it run on Windows 95? Does it run at a reasonable speed? The PowerPC emulator simply can't pass that test. So until next summer at the earliest, Emulators Inc. will focus on its existing business of developing 68040 based Macintosh emulators and Atari emulators.

Due to the problems with Windows Millennium and other problems we've been working on the past few months, there is a SoftMac 2000 Service Release 3 now being prepared. It is based on the version 8.0 of our emulation engine for Windows which we developed for SoftMac Professional. (Gemulator 2000 and SoftMac 2000 used version 7.0 through 7.2, Gemulator 99 used version 6, and Gemulator 98 used version 5. Version 4 was the Windows 3.1 version, while versions prior to 4.0 were designed for MS-DOS). The 8.0 engine is redesigned to address a number of problems we knew about in 7.x, such as the 1 gigabyte memory limit (the 8.0 engine can support up to 2 gigabytes of Mac memory), it actually uses less memory than the 7.x engine, boots faster, and eliminates a problem reported to us by a number of users about it simply hanging at boot time.

8.0 also merges a number of optimizations into a single engine, a "grand unification" engine, eliminating the need for, as we now have, 3 releases of SoftMac 2000 each optimized for a different scenario. Gone is the demo version, the "online" version, and the "premium" version. The 8.0 based SR-3 release consists of a single EXE file that handles all three scenarios without speed loss, running 68000 optimally, running 68040 code optimally in one emulator. Some features of the 8.0 engine we will strip out, such as the PowerPC support of course. Ultimately the 8.0 engine will be used in our Linux and 64-bit Window ports of SoftMac when we get around to those tasks.

So will there be a public release or beta of this? No. The PowerPC public beta we announced at Macworld is scrapped. We have several developers working on 8.0 and just hired two additional testers this month to put the 8.0 engine through its paces. As per our free upgrade policy and as we have done in the past, we will mail the new SoftMac 2000 SR-3 CD-ROM directly to registered customers. As we cannot offer product support to non-paying customers and to minimize the load on our support staff, SR-3 will not be posted to our web site. SR-2 will remain the posted version. The upgrade is automatic but I do ask however that customers who moved recently notify us of address changes as soon as possible or you will miss the free upgrade.

We will still demonstrate the PowerPC emulator technology at COMDEX and MACWORLD as planned, but as was the case this summer, it will be a technology demonstration only and not a product release. We are not going to get wrapped up in the frenzy of trying to ship a product for the sake of shipping a product by some artificial date. Apple, Microsoft, and Intel, they can all go fall into that trap and look foolish. Just look at the aborted gigahertz Pentium III, the 5+ year delay of Mac OS X, the 3 year delay of Windows 2000. That's not what this company is about.

To the tens of thousands of Atari customers that helped us get started years ago, I have not forgotten you. New releases of Gemulator and Xformer are planned and will be included on the SR-3 CD-ROM. As we did in the 7.0 products, we are addressing ease-of-use issues and complaints from users, making all the 8.0 based products easier to install and configure. If you are a paid Xformer or Gemulator customer, you can contact us to request your free upgrade CD-ROM.

To address the obvious concerns that we have somehow misled people in the past. We did not ever, at Macworld Expo or elsewhere, set a release date of the PowerPC emulator as some people mistakenly believe. We had hope to ship some time this year, but that simply will not happen. We also have not been promising PowerPC emulation for the past two years as some people mistakenly believe. There are 3 or 4 other development efforts out there in the world looking to create a PowerPC emulator for the PC, and one should not confuse their efforts with ours. Check your facts before sending flame mail!

But I will address my critics and make this offer. If you believe you've been mislead, either in believing that we'd be shipping a PowerPC emulator at some fixed date or that some feature that we plainly demonstrate at computer show after computer show after computer show doesn't work or isn't there, well, don't say we didn't give you the chance to back out. Until September 30th we will refund the purchase price of any copy of SoftMac 2000 sold by us in the past 90 days. That means if you ordered something from us between June 15th 2000 and the today September 15 2000, send it back for a refund no questions asked.

If you purchased it in the previous 3 months, between March 15 2000 and June 14 2000, return it for a 50% refund. You must return everything that was ordered and shipped to you - the CDs, the manuals, the ROM cards and/or ROM chips, and we'll apply the appropriate refund based on the purchase date. Prior to March 15 2000, sorry, no refunds, as you've had ample time to return the product already if you were not satisfied with it. Refunds must be returned and received by September 30th. If you decide to seek a refund, email us ahead of time so we know to expect your package in case of a late delivery.

The satisfied users, and we know most of our customers are quite happy, you will receive the SoftMac 2000 SR-3 upgrade CD-ROM. You will also at that time receive an updated registration code for SoftMac which will work with SR-3 (and which replaces your current temporary code if you purchased our product recently). Again, this will all be automatic, but please notify us of address changes and mail in your product registration card if you have not already done so.

Critics aside, our company already takes a number of measures to protect our customers and make our software easy to use. We post free demos, we post hardware requirements, we post step by step instructions with screen dumps on how to use and install our products. And still, in this day of MTV induced short attention spans, it amazes me how many people just blindly buy a product without so much as reading the specs. We don't apologize to stupid customers. We still refund the occasional customer every few weeks because someone thought they were buying a Windows emulator for a Mac. Read the specs please. And with this whole nonsense of paying for betas and upgrades, we're one of the few companies that not only offers free upgrades by web, we offer free upgrades on CD-ROM at no cost to the customer. I'd like to see Apple or Microsoft give away free upgrades of their products. We don't believe in their business model, the model of planned obsolescence and of squeezing money out of you at regular time intervals, including paying for beta releases. Emulators Inc. is not a public company, it doesn't have to please shareholders or stock market gurus, and so we don't need to resort to such blatant stupidity to stay in business.

So as I was saying, we are not going to fall into the trap that Apple, that Microsoft, that Intel, and even our competitors fall into. We are not promising any more freebies, we are not going to cater to the top 1% of the market even if it looks sexier, but we are going to continue to cater to the majority of Mac and Atari users who don't have $100 bills coming out their noses. Intel, Apple, and Microsoft, get your acts together and stop putting out defective products and setting a bad example for the industry.

Regarding the tutorial, yes, that is not in jeopardy! Back in 1987 I wrote my first emulation tutorial in a print magazine, on 6502 emulation, and last year started to write a new tutorial on how to do 68040 emulation. The tutorial was to be published by a well known programming magazine, but I simply missed the deadline due to my busy schedule. The idea of the tutorial was rekindled this summer when our company acquired Fusion PC and we rewrote that 68040 core. That gave me a lot of new material and definitely lots of example code for the tutorial. Since I cannot devote my full time to writing the tutorial, I will write it in pieces, beginning once again with 6502 emulation to start with basics, release the sources to the Xformer emulator, then work on up to 68000 emulation and Gemulator source code, and finally 68040 emulation and Fusion PC source code with before and after examples of how to optimize code. I feel these tutorials are important to all programmers, not just emulator developers, because the art of writing assembly code is slowly dying out, and I'm sorry, C++, Java, 15 megabyte executables, and "DLL hell" are not the answer! Any monkey can crank out code that half assed works. In the business they're called "contractors". But that's not how to write an emulator or any speed critical software.

If I missed something or if you have a legitimate question about our future products, please feel free to email me directly at darekm@emulators.com. Again, all you poor misled customers, please get your returns in by September 30th. Contact our sales staff at sales@softmac2000.com regarding upgrades and refunds, do not contact me about it. I welcome seeing everyone, customers and critics, at COMDEX in Las Vegas and at Macworld Expo in San Francisco this winter.

And now folks, let's all take a little break from this Mac OS X / Windows Millennium / Pentium madness and enjoy the Olympics. Sydney is one of my favorite cities in the world to visit and I highly recommend the trip to anyone. I only wish I could be there right now but I'll settle for watching the Olympics on TV. And I hope I don't see too many Apple, Intel, or Microsoft commercials.

Darek Mihocka
President, Emulators Inc.

September 21 2000

Since the letter above was posted last week it would seem people are finally starting to wise up. The "Intel massacre" taking place today, causing Intel, Microsoft, Dell, Apple, AMD, and other computer company stocks to drop sharply, even to below 52-week lows, really should come as no surprise to anyone. The technology joyride has come to a sudden stop and don't say I didn't warn you! The truth can hurt folks, stop wearing your rose colored glasses!

September 23 2000

The weekend after the Intel Massacre and investors (or should I say "gamblers", c'mon Soccer Moms, stop gambling away your children's futures away), investors can finally take a day off and tally up their losses. While I'm not going to pull an Al Gore or a Rush and pretend I predicted the stock market disaster, I can't say the signs weren't obvious. I hope at least one person out there that had a chance to read my letter of September 15th was wise enough to yank any Intel Apple and Microsoft stock from their portfolio. Watching Intel plunge more than

$30, or 40%, from its hyped up prices just 3 weeks ago was very refreshing and well deserved. Watching Microsoft get dragged down to a 2 year low is also well deserved for them.

It's sad though that it took the smell of MONEY, or the chance that Intel would make less of it, to give "investors" the kick in the ass they needed to dump that stock. Not the delay of the Pentium 4, not the complete abortion of the 1 GHz Pentium III, not the thorough butt kicking that the AMD Athlon chip has been giving the Pentium III for the past year, none of those hard technical facts influenced dreamy investors. In fact, after last month's Pentium III abortion, Intel stock actually surged for a few days, defying all rational thought. Again, it took the smell of money to actually wake them up. Just an example of how hype driven this computer market and how poorly educated most people, even Wall Street "experts", are about computers.

Let's look at some of these tech stocks:

�� AMD:

*

prior to this year, not a Wall Street darling, and deservedly so. It's AMD K5 and K6 processors were cheap knock offs of Intel Penitum chips. Yes they were cheaper. But were they faster? Hardly. AMD stock stalled at about $10 and below.
*

late 1999 - AMD launches the AMD Athlon. Emulators purchases a system for testing and we get blown away by the performance, up to 40% faster than the Pentium III. We post a strong recommendation on our web site to use AMD Athlon processors. Other people have similar results, AMD stock starts to deservedly rise.
*

after demonstrating a 1 GHz processor at CeBIT Hannover and announcing it here in the U.S. a few weeks later, stock really starts to surge, well above $20. But one has to wonder, almost a million people go to the CEBIT Hannover show, and yet again, investors did not react immediately to the showing of the 1 GHz processor at CEBIT, they waited to react until after it was "announced" weeks later. Again, stupid Wall Street gamblers with no technical background playing with a lot of money. Take it away from them!
*

AMD deservedly reaches a high of almost $50 during the summer.
*

September 22 2000 - as the titans Intel and Microsoft collapse under their own weight, AMD is (and I think unfairly) also punished in the Intel Massacre and drops to $24. Again, stupid investors making knee jerk reactions. "oh, the market is down, sell, sell" without knowing why.
*

September 23 2000 - perhaps a sign that there is intelligent life out there after all, investors reward AMD with a 10% gain while Intel collapses over 20% in a single day. I happen to like the "K7" (Athlon) architecture and will be buying more Athlon based machines for my own use. Too bad Dell, your love affair with Intel is keeping you out of the game.

As a side note, I just loaded up on a ton of AMD stock to put my money where my mouth is. We'll see how I compare against the Apple Intel and Microsoft stock holders.

�� Microsoft:

*

end of last year, even after preliminary news that spelled disaster, stock is at $120 a share, riding high on company propaganda about "getting off"

*

April 2000 - as every April, the whole tech industry cashes in stock options to pay the previous year's income taxes on even more stock options. Stock option king Microsoft leads the market meltdown by dropping to about $70 (c'mon Soccer Moms, every April is bad, why did you all act so shocked when the Dow dropped 700 points the day before taxes were due? I dumped my stock portfolio in late March and I don't even have a business degree, he he)

*

May 2000 - Microsoft gets spanked big time - $60 - investors realize the honeymoon is over

*

July 2000 - the annual running up of Microsoft prior to the release of the annual report - breaks $80, those silly Microserfs breathing a sigh of relief.

*

September 22 2000 - no one gives a damn about Windows Millennium - the lamest and most boring Windows release in years - stock flirts with $60 again. Sorry Microserfs, get back to work on Windows NT 6.0 (the long promised merger of Windows 9x and Windows NT).

Interesting news article on Microsoft's own news arm - MSNBC - about how poorly received Millennium is. Someone at MSNBC is going to be fired for reporting it like it is (so better read it before they yank it): http://www.msnbc.com/news/460342.asp

�� Apple:

*

strong surge in stock last year (from under $20 to over $50) as they crank out more and more colors of iMacs for brainless idiots and keep promising that NT clone called Mac OS X.

*

stock hits new high in July as Mac users eagerly await the rumored free release of the Mac OS X public beta at Macworld Expo New York. Even I was excited on my way to New York.

*

July 2000 - oops, no beta, oops, product delayed another 6 months (what's that now, 5 year or 6 year delay, I lost track). Stock drops below $60, below $50, wheeeeeeh, flirts with $45, a 25% drop in the two weeks after Macworld. Even the Mac faithful seem to be getting nervous!

*

September 2000 - stock surges again to $60 on news that the public beta is once again coming out

*

September 23 2000 - Thunk! Stock dives to $50, manages to sustain $52, after people start getting their hands on the Mac OS X beta and see that it does mostly suck

And yes, our Mac OS X beta CD-ROM did arrive this week. I installed it on our big expensive 512MB 500 MHz PowerMac G4, and it's quite under whelming as many of you will find out when you get your beta. Once you install Mac OS X, say goodbye to backward compatibility. Only Mac OS 9 is supported in emulation, (or "Classic" mode as they call it) and so Mac OS 8.6 and earlier are history as far as Apple is concerned. So were many of the older 68K and PPC apps we tried to run on it. Lots of ideas stolen from Windows NT, OS/2, and Linux, and just way too many flashy buttons and graphics sucking up CPU power for no useful purpose. I'll report more on OS X as I pick it apart some more. But all signs back up my logic from last week that Mac OS X will be a poor upgrade path for many existing Mac users, not to mention to it will make your wallet poorer.

It's interesting that MSNBC was actually not as critical of Mac OS X as of its own master's product, however this article about the recent Mac OS X beta launch in Paris does mention many of the concerns by Mac users in France as I witnessed here in Seattle last week, namely slow speed and high cost. Read it yourselves:
http://www.msnbc.com/news/459088.asp

While the email Inbox was certainly full of "you're an idiot, shut the f**k up" emails last weekend, the stock market collapse this week did shut a lot of people up. Regardless of the vile and rude feedback, I am sticking by last week's decision to postpone work on the PPC emulator. In light of the poor stock performance of the major computer players, hopefully this is the kick in the ass they need to stop bullsh*tting the public and start producing. Microsoft needs to ship a service pack to Millennium right away. Apple needs to remember to ship Mac OS X hopefully before the next Star Wars film is out (I mention that due to the May 2002 expiration date on the beta!). And of course Intel needs to either ship a gigahertz+ processor or be shut down by AMD.

The feedback I'm getting from people about Mac OS X is a mixed bag, some people still claiming that the "final" release will run on 64 meg machines just fine. That remains to be seen. Others agree with me that the hardware requirements are just too high. Someone also pointed out to me that in 1997 Steve Jobs promised that all the current (i.e. 1997) machines would run the new OS, yet the latest Mac OS X specs require a minimum of a 1998 G3 machine. Hmmmm, is it really true that Mac OS X will run on 601 and 604 based processors and on older Power Macs? Time will tell.

I'm not one to hold back an opinion, but I also don't make uneducated statements. Which is why I'm not here talking about microwave cooking. I do my homework, I do the footwork, I go to CEBIT and I witness the gigahertz Athlon myself. I go to Macworld and their other shows to see what they actually have. I talk to real live Mac users and ask them their opinions. Based on my research and experience, I strongly believe that Apple is about to shoot itself in the foot with Mac OS X and emulation _will_ be the solution for running older Mac software on new fast hardware in the future, just as it made sense in 1997 when I started this venture. But it won't make sense to do it on Mac OS X, which itself will be running emulation, and is an NT clone with double the horsepower requirements of NT. It just doesn't make sense. If you want the power of NT or Linux, you want cheaper hardware, you buy a PC today and you run a Mac emulator today and not wait till 2001 or 2002 for Mac OS X. It's just that simple. I'm in the business of emulation because it was the obvious solution 3 years ago and it still continues to be the obvious solution.

As I've explained, we're not canceling our PowerPC emulation work, we're just putting it on hold until the market is right for it, and we're certainly not going to waste time doing any work to make Mac OS X itself run in emulation. We'll support Mac OS 9 first, then possibly Mac OS X but not for a whole. Rude emails be damned. I will be present at both Comdex Las Vegas and Macworld San Francisco this winter and will be on hand at the Emulators booth at both shows. I more than welcome hearing in person your opinions. Don't just hide behind email. Come out to a show. SEE what people actually think and hear and see, and then make an opinion. That's all I ask that people try to do - THINK - before they send me an email shooting off at the mouth about things they don't really understand.

Where else could I sit on my butt and surf the Net, and get paid for it? By
percentage there are actually MORE Aussies living in NZ, cant explain that

one.

PS saw the Womans volley ball last night:-)

Mark

Crying on spilled milk.... that we macsters will have a new OS? Better
late than never. In the meantime in the last two years, Apple has come
out with iMacs, G4 Towers, G4 Cubes, Aiport Technology etcs...You get the
point.. Whats the maker of the Milan excuse?

No, Sincrap - we calls it "tryin' ta play catchup", as you keep usin'
as a sledgehammer. When ya considers dat even Ataris have had true
pre-emptive multitasking wit' MagiC for years, OSuX looks like a
johnny-come-lately....

ha ha - typical troll crap! Dis comin' from da same guy who claimed dat in Germany dey were selling tons an' tons of iMacs - turns out dat Crapple now holds a mighty 2% of all PC sales dere. Surely dere gonna take over Europe wit dose numbers, NOT. Not in Atari and Amiga country. And especially not at da snail speed of da G4 - it's up ta a mighty 550mHZ, folks.

An' ya'll have ta re-tool yer definition of vapor, sincrap - 'cause it doesn't jibe wit' da traditional. Milans do exist, and Milan II was shown in prototype which many people saw. Not da definition of vapor. Copland is da definition of "vapor".

BTW, I've been readin' all yer postin's via Deja, and I've nevah seen such a pile of crap comin' from such a swell-headed cretin wid no life since da days of Fnarky. Are ya sure you've never been institutionalized or had help from a headshrinker?

>

�News: �Technology

Apple warns on earnings
Computer maker cites slow education, G4 Cube sales for shortfall
September 28, 2000: 6:34 p.m. ET

NEW YORK (CNNfn) - Apple Computer warned on Thursday that its earnings for the fourth quarter ending Sept. 30 will be substantially below expectations because of slower-than-expected sales in September.

The Cupertino, Calif.-based company said that it expects to report revenue of between $1.85 billion and $1.90 billion, and earnings per diluted share, excluding investment gains, of between 30 cents and 33 cents, when actual results are announced on October 18.

Analysts had expected Apple (AAPL: Research, Estimates) to earn 45 cents per share for the quarter, according to estimate tracker First Call.

In response, Apple's stock plunged to $29 in after-hours trading, down 46 percent from its Thursday close of $53.50. The decline knocked about

$8.9 billion off the company's market value.

Fred Anderson, Apple's chief financial officer, said that the company's education-related sales, which normally peak during September, were lower than expected. In addition, its Power Mac G4 Cube is off to a slower-than-expected start, he said in a statement. Apple indicated that the sales slowdown is more than a one-quarter problem.

"We are currently re-evaluating our plans going forward, and will provide lower growth targets for next quarter and the next fiscal year when we announce our final results on Oct. 18," Anderson said.

"We've clearly hit a speed bump, which will result in our earning, before investment gains, approximately $110 million rather than the expected $165 million for the September quarter," said Steve Jobs, Apple's chief executive. "Though this slowdown is disappointing, we have so many wonderful new products and programs in the pipeline, including Mac OS X early next year, and remain positive about our future."

Third-quarter report contained signs of slowdown

Apple's third-quarter earnings report, which came out last July, gave hints of a slowdown in the company's business. When the company reported its third-quarter results, it said that sales of its iMac machine were below expectations, apparently because consumers are waiting for the company to introduce a new version.�

"I don't think we have any evidence that it is an industry-wide slowdown," Anderson said during a conference call with analysts after the third-quarter earnings were released.

Merrill Lynch analyst Steve Fortuna had forecasted that Apple would have 13 percent unit growth and an 8 percent rise in average unit prices in the third quarter. Instead, Apple delivered 12 percent unit growth but only a 3.5 percent increase in average unit prices because of changes in its product line.

Not industry-wide

Apple's problems appear to be limited to the company, rather than being part of an industry-wide slowdown in personal computer sales. After Intel �(INTC: Research, Estimates) warned that its third-quarter revenue growth could be as little as half what some analysts had expected, analysts surveyed PC companies to see if they also were experiencing slumping sales. Several of the major PC makers responded that their revenue and earnings were on target for the quarter.

Computer maker Hewlett-Packard (HWP: Research, Estimates) announced one day after Intel's warning that it should meet revenue and earnings goals for its fiscal fourth quarter and that it would conduct a $1 billion share-buyback program. Likewise, Dell Computer's (DELL: Research, Estimates) chief executive said that the company is on track to achieve 30 percent revenue growth for the full year and that Dell hasn't changed its outlook because of Intel's problems in Europe.

In an interview on CNNfn's Moneyline News Hour Thursday, Michael Capellas, chairman and chief executive of Compaq (CPQ: Research, Estimates), the world's leading PC maker, pointed out that his company operates in a much different market than Apple and said Compaq "feels good" about where it is headed, strategically. [160K WAV or 160K AIFF]

Capellas would not comment specifically on the company's third quarter results.

Apple's revenue and earnings have been driven largely by sales of its iMac and PowerBook computers. As of the end of the company's third quarter, Apple had shipped 3.7 million iMacs since its introduction. Apple introduced the G4 Cube on July 19. The Cube, which is less than one-fourth the size of most PCs, won praise for its innovative design and the ease with which accessories could be added. However, it was criticized for being too expensive at $1,800 and for shipping with too little random access memory.�

I'm sure the news is everywhere by now, but here are two refs:

http://yahoo.cnet.com/news/0-1006-200-2888711.html?pt.yfin.cat_fin.txt.ne
http://www.upside.com/Money/39d3c41c0_yahoo.html

Of note, the description of G4 Cube sales being slower than expected.

Also, can someone explain why "a surplus of older Power Macs in the retail channel appeared to be hurting sales of the new machines."? Wasn't this something Apple allegedly went to great efforts to prevent?

He he he. Lets see. Sales will be $1.9 billion up substantialy from the
same Quarter in '99' with profits in excess of $100 million. Did Atari
ever had these kind of sales?

Lets see.. Q4/99 $1.3 Billion versus Q4/00 $1.9 billion. Looks like a
huge sales increase.

let's see, projected sales DOWN 33%. Apple issues warnin' that dey're
not gonna be anywhere NEAR what dey've projected. Word comes out dat

older iMacs are cloggin' da channels, preventin' sales of da new crap,
er crop. Especially point out non-sales of da overpriced, underpowered,
underfeatured Cube.

You're full of beans...The prior iMac line is about gone, no surplus. The
latest issue of MacWarehouse and Mac Club has no listing of the older
iMacs. The older iMacs when quick when retailers dropped the price.

Nice try!

sinclap!

Not substantially down. Sales are actualy up by $500-$600 million
according to Apple's projections. Not enough to meet their goal target.

>   who's laughin' now. sincrap?

I am. Will accumulate the stock at half the price and see it increase
later in the year.

Apple was projecting $2.1 billion earlier in the quarter. Apple did not
refresh the iBook and PB line until mid September which was to late to
affect the quarter sales. Company used Q4 to dry out the channel of the

```
older PB and iBook line.  Q4 is usually a product transition time and
execution is tricky..  But watch out for Q1.

and to da many others who you've tried ta crush and failed miserably. Like let's say Dreibelbis, van Tilbourg and Particle Salad - all three have reduced ya ta a quivering bag of rat droppins smellin' of alcohol wheneva ya made tha mistake of takin' 'em on. Particularly Salad, who's shown yer a complete idiot when it comes ta da video market. Even taday, whenever yer name is mentioned, it's mentioned in da same breath wit' "no life", "imbecile", and "liar".

no, sincrap - tryin' ta compare TOS 1.0 ta OSuX is pathetic. Ya have never used MagiC, which has grown inta a really nice OS wit' some great widgets. And solid as a rock. Everytin' OSuX is frantically tryin' to copy as it slips later an' later. Even Linux an' Windows NT have betta pre-emptive multitaskin' den any Mac OS, and had it first.

we'll go anywhere we want, and say anythin' we want. nobody here is afraid of a little wimp like sincrap, an' nobody's gonna be pushed around by yer pathetic bully boy antics which've failed since day one. Give up now, weinie boy.

da one rapidly goin' over da cliff? Da one dat can't crack 500mHZ when da dreaded Intel an' AMD have gone 1 gig and beyond? Sorry, sincrap, but we ain't impressed wit' doctored benchmarks an' outright lies. Neiider are new users, who are seein' through Jobs an' your smoke n' mirrors.

Dere are still Mac users out dere who still use da ol' processors - and ya still called dem idiots fer usin' em. Foot in mouth time fer sincrap!

> >
> >   please everybuddy note - sincrap's called all Macs made wid dose

and dey are all still workin' and still productive an' usable. I've read many articles about people who still use dem, and make dem usable for all dose less fortunate. Ya just called everyone who uses such a machine nothin' but worthless peons just becuase dey use an older system dat still works ta dere satisfaction. Shame on ya, sincrap!

>
> >   Da Palm Pilots use a 68000 - millions of dose are in use. Are all
> > Palm Pilot users idiots?

>
>
> Were talking about a handheld here..

a handheld dat's sold ta millions and has proven very useful. Again, are dey all idiots fer usin' a device dat uses a microchip ya personally despise becuase it's used in an Atari?

> > > You were saying...
> >
> >   get da crap outta ya ears, Sincrap - it's da result of keepin yer

nobody here named chunks - are ya seein' an' hearin' things? ah, yeah, Dan warned me if ya started usin' dat name dat means yer losin' yer argumant and yer cool. looks like I'm makin' points.

he also told me dat you also start mispellin' yer words - guess yer huffin' an' puffin' in a rage, eh, sincrap?

> >   ha ha - typical troll crap! Dis comin' from da same guy who claimed

> > 550mHZ, folks.
>
> Oh PhULeaze! What sales are the Milan? The iMacs have done well in
> Germany recently and bonkers in the UK..

da only ting bonkers is youse, sincrap. in spite of all yer jumpin' up an' down about how crapple increased market, crapple only managed 2% of da market in Germany - dis was reported on da Mac Show Live a few weeks ago an' even da host was not impressed wit' da results despite da hype, and I'll trust dem over an annoyin' little hemmeroid like sincrap. crapple hasn't made any friends in Britain eider wit' dere shenanigans over not keepin' dere word on showin' up at trade shows.

 What marketshare does the Milan
> have?

we accept a small marketshare, sincrap, cause we don't into weenie-pullin' contests over a usefull tool. not unlike a certain useless tool named sincrap...

>
> >   An' ya'll have ta re-tool yer definition of vapor, sincrap - 'cause

> ancient history.

`  which was hyped an' hyped by crapple as "da next big ting".
everywhere an' evering ya saw in da crapple press was about Copland.
Apple pull plug on Copland. Copland vapor. Finis. Passed on. ceased ta
be. pinin fer the fjords.

   really, is dat da best ya can do, sincrap? i can pull a bettah
argument outta my ass.

>What other software has Apple come out as well?

   ya mean like Appleworks 6 - knwon to all an' many as "Appleworks
Sux"? or da vapor drivers fer da extended keyboard dat's comin' "by
January" why does it take genius crapple engineers Five Months ta write
a proper driver fer an extended keyboard, sincrap?

>
> >    BTW, I've been readin' all yer postin's via Deja, and I've nevah
> >    seen

> Only to you Chunks!

   again, who is dis chunks? anudder one of yer hallucinations? why ya
use yer hallucinations name when yer losin' an argument ta Dan? He
certainly not fit yer hallucination, he actually pretty fit.

> >
> >    more likely finger paint on da wallpaper - mommy spank!
>
> Good one chunks..

   i don't see no chunks - except da ones ya just barfed on da floor.

Apple at the crossroads
Computer maker struggles to appeal to users beyond its loyal customers
By Staff Writer David Kleinbard

September 29, 2000: 4:57 p.m. ET

NEW YORK (CNNfn) - Apple Computer, long an orphan in a world dominated by IBM-compatible personal computers, stands at a crossroads.
One day after Apple (AAPL: Research, Estimates) warned that its fourth-quarter earnings and revenue would fall below expectations, investors decided it was no longer a core holding, and investors sliced its value in half. In late afternoon trading Friday, the stock was down $27.50 at $26, a 51 percent plunge. The market's reaction caused Apple to lose about $10 billion of market value in one day. Trading volume was more than 20 times Apple's daily average.

"We've clearly hit a speedbump, which will result in our earning, before investment gains, approximately $110 million rather than the expected $165 million for the September quarter," said Steve Jobs, Apple's CEO, in a statement. "Though this slowdown is disappointing, we have so many wonderful new products and programs in the pipeline -- including Mac OS X early next year -- and remain positive about our future."

>try "goin' off da cliff" <

>Most of the analysts who downgraded Apple Friday said that the revenue and earnings shortfall was a company-specific problem, not a sign of a slump for the entire personal computer industry.<

>"In our opinion, investors should not read this Apple blowup as evidence that PC demand is weak," said Merrill Lynch analyst Steve Fortuna in a research note. "Apple is, in many ways, a market unto itself."<

>Apple benefits from having an extremely loyal customer base that verges on the fanatical. However, to keep growing, the company needs to sell products and services beyond its current installed base, converting computer users from the "church" of IBM.<

(sound like certain no life Macccie troll? wait, stupid sincrap too yellow to actually take on PC users, he instead take on smart Atari users who kick sand in face)

>They are primarily selling into their installed base and are not expanding their markets," said Kevin Knox, a research director at the research firm Gartner in Stamford, Conn. "Design innovation only gets you so far. It's hard to continue growing if you keep selling into your installed base."<

(where all dose new users, sincrap?)

>"The important question the shortfall raises is whether Apple will be able to attract new users to the Macintosh platform to continue to grow its market share," said UBS Warburg analyst Charlie Wolf in a research note. "The shortfall raises ominous questions about whether it can." Wolf lowered his fiscal 2000 earnings estimate for Apple to $1.71 per share from $1.86 and his fiscal 2001 estimate to $1.80 from $2.10.

Balance sheet is strong

No one is worried about Apple's solvency. The company has had 11 consecutive profitable quarters and intends to be profitable in the fourth quarter also, although those profits will be below previous expectations. In addition, Apple finished the quarter with a healthy $3.8 billion in cash and short-term investments.

>On the other hand, Apple's share of the computer market is in the low single digits. <If the company loses what little share it has, software developers may stop writing for the Apple platform, and dealers may stop selling the machines, analysts said.

>"It's very difficult when you have as low a market share as they do to get dealers interested," <said Bruce Tognazzini, who worked at Apple between 1978 and 1992, ending up with the unconventional title of Human Interface Evangelist. "A dealer has to sell a Mac, whereas he doesn't have to sell a Windows machine, since the Windows machine is a known quantity."

(dis from Apple employee who knows stuff. not like phony like sincrap, who make things up.)

"Steve Jobs has done a good job of selling, and the Apple interface is still superior, but he doesn't have critical mass," said Tognazzini, who now is one of the partners at the computer design firm Nielsen Norman Group.

In addition, Apple's announcement on Thursday was especially troubling because it noted that the company's sales have been weak in the education segment, a part of the market Apple historically has dominated.

>"We do not see this as a one-quarter phenomenon for Apple, but rather as the beginning of many tough quarters ahead," Merrill's Fortuna said.<

(Merrill lynch guys smart. kno market. stupid sincrap no kno good stock even if it bite bum)

Company was saved by innovative design

As recently as December 1997, Apple was at the brink of ruin. The company had an operating loss of more than $1 billion that year, and its stock was below $7 by December. In 1997, Steve Jobs returned to Apple, after having been cast out of the company in 1985. In the ultimate form of vindication, Apple paid more than $400 million for Next, a company Jobs started after being expelled from Apple.

Jobs brought Apple back from near death with the trendy-looking, colorful iMac and PowerBook lines. The iMac -- which now comes in colors such as indigo, ruby and sage and starts at about $800 -- has shipped about 3.7 million units since its introduction. Apple also was helped in August 1997 when Microsoft (MSFT: Research, Estimates) agreed to invest $150 million in Apple and continue making its Office suite for the Mac. As part of the deal, Microsoft's Internet Explorer became the default browser for the Mac operating system.

Apple's most recent major innovation was the G4 Cube, a machine so elegant that many observers said it deserved a place in the Museum of Modern Art in New York.

"The G4 is about the nicest industrial design that I have seen anywhere," Tognazzini said

.

>While the G4 is powerful, easy to upgrade, and less than one-fourth the size of most PCs, it has been criticized for being too expensive at $1,800 and for shipping with too little random access memory. In its press release issued Thursday, Apple said that sales of the G4 are off to a slower-than-expected start, providing no detail on why.<

(me know why. and me no claim ta be crapple power rep, too much. too litle. to late.)

>"We believe that the Cube is too pricey at $1,799 to appeal to consumers in volume, while few professional users are going to opt for the Cube based on its award-winning design,"<
said Merrill's Fortuna.

No compelling reason to upgrade
^^^^^^^^^^^^^^^^^^^^^^^^

>Aside from the G4, Apple hasn't introduced new products recently that give its customers a compelling reason to upgrade, analysts said.
"I don't see anything next quarter that will result in massive upgrades," said Gartner's Knox. "Coming out with new colors is not going to drive a substantial number of upgrades. Going from blueberry to ruby is not a good reason to replace your machine."
"Apple has a lack of any real new products to drive strong year-over-year unit growth," Fortuna said in a research note. "Its existing products are getting stale."<

(again, i coulda told dem dat. me no rocket scientists. perhaps Jobs should hire me, me give good ideas and no suckup like sincrap)

Knox said that Apple needs to derive more revenue from sales "outside the box" -- products and services outside of the computer itself. Apple needs to follow the lead of Gateway Computer (GTW: Research, Estimates), which has been successful at generating profits from extra services, such as Internet access, he said.

"Bragging about megahertz and megabytes is a thing of the past," ^^ Knox said. "They need to look at solution sales. Gateway is a great example of that approach."

(knox real smart. call sincrap dinosaur troll . sincrap smart like streetcar)

The Microsoft factor

Apple's eventual salvation or death could come at the hands of software giant Microsoft. There are many analysts who believe that Microsoft has chosen to keep Apple alive to avoid having further scrutiny from the Justice Department, which, along with the attorneys general from 19 states, is pursuing a sweeping antitrust case against Microsoft. Microsoft's willingness to continue producing its Office suite for the Apple platform is considered key to Apple's survival. Office serves as a cross-platform application, since an IBM-compatible PC running Word can read a document created in Word on a Mac.

>"Gates has kept Apple alive to get the Justice Department off his back," Tognazzini said. "All he has to do is stop making Office for the Mac and that is the end of Apple. He keeps Apple alive, but very weak."<

(is dis true? is jobs really gates puppet. so dat movie was True.)�

i tried to explain to sinclap that for apple to go it alone, it simply
will not work, they have a nitch market, to expand that market you need
innovative software written to take advantage of the unique hardware
architecture that motorolla machines provide.
to get that software you need to get atari/commodore small developers on
board to get them coding modern software for all 3 machines.
the code is similar as far as i know, and can be ported over with out
all of the bloat, and bugs in pc stuff.
he could not understand that apple is not benefitting from well written
software taking advantage of the good hardware, instead they get pc
portovers bloated, and bug ridden and just slightly faster, thats not
enough to show customers a real difference.
but if you had code written for 3 thriving nitch platforms you can find
some real jewels for all.
instead he gave me a juvenile response about a apple plan to double
there market share, every one hopes for that, but how many can.
apple cannot do it on hardware alone, just ask any surviving atari
dealer.
thanks,
lance

How would you know? Lots of folks who have had the old Performas plus
some 040's thrown in are making a home for the new iMacs such as the $799
one.

What marketshare? Again only in your mind. What a load of BS. The Milan
has no choice but having less than one percent of one tenth...if any at
all. So who developes for it?

> > Copland existed for developers...Is that the best you can do? Copland is
> > ancient history.

> be. pinin fer the fjords.

Copland has been put to pasture period...Get over it! Apple never hyped
Copland publicly...Only in your mind...In the meantime, how mant Apple

product families have been created since 1995? Compared to the progress
of the Milan II? whats so difficult to bring out stinky beige box? Are
the folks behind it incompetent?

>   really, is dat da best ya can do, sincrap? i can pull a bettah

AppleWorks 6 is fine now that 6.04 is out..Compared to the left over Atari
ones. I won't even go there...

You must be still stuck in the classic days...Have you paid attention lately. Apple does have software that has no peers in the wintel land such as iMovie, Final Cut Pro, QTVR, QT, Web Objects, Sherlock, AppleScript and the list goes on. Plus OS X, which is bringing in the shareware folks from Unix and linux land..Apple is doing fine thank you.. Q4 is tends to be a challenge due to product line change overs...Sales were up by $500 million plus over the same period last year...

Your an idiot. Most fianacial analysisists don't understand Apple and have been burned many times in the past...Remember three years ago when most stated that Apple would not exist pass 2000?

> >They are primarily selling into their installed base and are not
> expanding their markets," said Kevin Knox, a research director at the

Some one who has been gone for 8 years is hardly anything new...According
to Mitch Mandich, Apple is selective on who they will partner with at
retail. They have turned many away who banged on their door.

> "Steve Jobs has done a good job of selling, and the Apple interface is

You do not know my position on the G4 Cube, pro or con, its market
segmentation, positioning etc...Only those on the team, you know the
internal stuff. Thats were it's going to stay...
>
> >"We believe that the Cube is too pricey at $1,799 to appeal to

I will save this one after Q1 is over..Well see. In the meantime I adding
more aapl to my portfolia...

> (again, i coulda told dem dat. me no rocket scientists. perhaps Jobs

> You must be still stuck in the classic days...Have you paid attention lately.

yes, he has, TiFKAS - Apple is currently back in "beleaguered" mode. Even they have admitted that sales of the high-end systems are way down, which are the real bread and butter for them to make money. The fact that iMac sales are ALSO way down despite the makeover is big trouble.

I think the thing that has REALLY triggered the current problems are Apple's admission that they've taken a big hit in the education market. This is one of their specialties, and to have them lose any significant part of that market, AS THEY ADMIT, is certainly a sign of trouble.

Apple does have software that has no peers in the wintel land
> such as iMovie, Final Cut Pro, QTVR, QT, Web Objects, Sherlock,
> AppleScript and the list goes on. Plus OS X, which is bringing in the
> shareware folks from Unix and linux land..

problem is, TiFKAS, that NOBODY IS BUYING NEW APPLES LATELY. Particle Salad has already explained at length why a G4 is currently NOT a good choice for video production (in part because of Job's absolute refusal to produce a 6-slot PCI Mac, which is crucial to run the hardware they need), and why Final Cut Pro is STILL Not Ready For Prime Time in regards to professional video production. But you still ignore this and wibble on and on and on with your RDF, which in these parts is the equivalent of "I do so have a bigger one than you do!"

I saw OSX in action at a dealer last week, and it has some really nice functions. HOWEVER, it's obvious that there's going to be a lot of work still before this OS is going to be ready, especially in light of the fact that OSX was quite sluggish - and this was on a G4 Cube! Even MagiC on an early ST runs much faster! Add to that that the beta didn't even have drivers for USB and Firewire, which are crucial in light of what current Apple hardware is capable of. And it had better have plenty of new software ready for it when it finally does launch.....

Perhaps the reaction of the market is going to be the wake-up call for Jobs to make him realize that it's the CONSUMER who calls the shots on what he needs, NOT the manufacturer telling him "the is what you need, and this is all you're gonna get - we know best". Marketing hype just doesn't cut it anymore, just look at the failure of the Cube.

Apple is doing fine thank you..
> Q4 is tends to be a challenge due to product line change overs...Sales
> were up by $500 million plus over the same period last year...

the consumer and the market currently do not agree, TiFKAS. Even Jobs agrees that there are serious problems. You're actually defying Steve Jobs? Get out of the Reality-Distortion Field and start breathing some oxygen....

   crapple market research crap - just like crap crapple market hype.
why ya use nothin' but one-side crapple garbage ta prove point. oh sorry
me forget, ya never had point, never will.

   by da way, sincrap, crapple market share currently 3.7% across world.
Up .7% in 3 years. Dis is progress?

3.8 bill? chicken feed. company like Dell an' chrysler have much
bigger for rainy day. soon jobs put jet crapple gave him on eBay ta save
company.

my points xactly. which why you prtend ta be power rep, even crapple
not dat dumb ta hire idiot witout brains ta talk for dem, even idiot dat
is rude n' wit big swelled head dat cant get thru door

we already kno sincrap. sincrap too stupid ta be on team. sincrap to
stupid ta work fer crapple. sincrap just stay home all day witout
friend, witout girl, in moms cellar, surf net all day an' pop zits.
sincrap make believe he big shot. sincrap pushin' 30, sincrap need ta
get life.

crapple think dey kno market, crapple try ta sell cost to much wit
not much RAM an' little expansion pc based on shape ta home user.
crapple get kicked in bum, admit cube failure. even razor not dat
stupid, mr. lincoln said dat ya can't fool all da people all da time.

> >

   compared ta stupid sincrap? razor tell jobs things he not want ta
hear. if jobs get mad at me and swear, razor yell louder an' swear back,
i hear jobs impressed wit' anyone who has backbone. sincrap have no
backbone, make it easier when jobs tell ya ta bend over
>

   no reel facts ta back up, sincrap rely on rumor. crapple can't do
somethin' original, crapple copy gateway. sincrap cant spell alleged,
teechur make him sit in corner wit' pointy hat (not harry potter)

   sincrap miss point - knox call sincrap disnosaur troll. dino have
small brain like sincrap. dinosaur die. maybe we get sincrap DNA,

```
disnosaur come back!

   only fiction is sincrap sayin' he big shot crapple salesman.
everybuddy know gates put jobs foot over fire and threaten ta crush
apple like bug if he don't put Exploiter on Mac desktop. jsut like gates
put gun ta scully's head if he even dare ta come out wit' basic program
ta compete wit microsnot. it all documented. gates give word, pull
office, crapple take dirt nap. end of crapple, sincrap buy PC and harass
mac users fer change, as how he work, like how he shaft amiga user after
bein' big cheerleader fer dem. like how he shaft atari user afer havin'
slight thing happen dat make him go funny in brain. sincrap ferget
computer is tool, not other tool 'tween legs.

sinclap,
my son has a g-4, i watch this stuff, it is not much faster than the pc, and he even admits it.
are you so sure that the code that is used in your mentioned post is not pc code ported to apple?, or altered for apple?
you need really good fast software to impress the average user.
they have been brain washed that speed is everything, and when i see a apple program booted that is at best marginally faster, even i am not impressed, and i hate the pc.
being stuck in the past is not all that bad, afterall the mac is a machine from the past, the pc is considered modern since most experts say that the modern computing era started in the early 90's.
the mac dates back farther than that would you not say that sinclap?
i have found that to overcome the hysteria of speed, you need good tight compact speedy code that takes advantage of really good hardware, thus nuetering the cpu speed, and wowing the average type in how did they do that, and i want it. instead
apple has fallen into a trap trying to outspeed the pc, and not building a business based on really good software that really shows off the hardware.
jobs is a good hardware type, but so was jack, we know what happened to jack, jobs may be next.
now i do not want this, i think that all should benifit from good solid code, but that code cannot soley come from apple, there are just to many good coders for the other 2 platforms to pass them up.
i am not so sure apple has that many good motorolla coders left, after all when the pc bunch took over apple, everything started to bloat like the pc.
you answer the merits of my arguments with very illogical answers, or borderline insults.
why am i getting the idea that i may be trying to convey simple business strategies to a adolecent, or immature person?
thanks,
lance

me accept Milan market for what it is - razor no dummy. razor wish tings better. me just givin' boots ta sincrap fer bein' such a pie-in-sky moron who hang on every word jobs say witout havin' one thought in head 'bout what's real. 'bout time dat big bully got what comin' ta him.

ya call 3.7% worldwide decent? 'specially after two years, razor no understand why 0.7% increase consider good. face it, microsloth win big battle by playin dirty pool, other platforms lose includin' crapple. hope linux make difference. Milan get there act togteher, hopefully soon - no want ta have ugly windoze box on desk.

however, all not right in mac land - were I live, mac dealer drop like flies, dont help dere titles are da same month after mont. local dealer here have sims for 85 clams - how can honest mac fan affords? and mac magazine gettin' thinner an' thinner. razor buy old copy of macworld few months ago from goodwill, it about as thick as vogue. new macworld about 1/4 as thin - soon, if tings don' improve, macworld be as thin as comics book.

```
   razor like new amiga by the way - smart. too bad new amigas have same
market share as milan.

   dis is advocacy. i'm an advocate fer atari. dat means razor have
comment 'bout tings. sincrap no like atari, tell big lies about it, an'
bigger ones 'bout apple - an he's certanly no friend of yer platform
either. razor just take sincrap down a coupla notches. yer welcome ta
put da boot ta me anytime ya want, me no take personal.

Why concern yourself with the Apple market share when the Milan market share
is virtually zero?
If you consider the Apple misfortune of having a decent market share, decent
distribution and decent software availability, not to mention decent
performance (even if the OS sucks) , it's not looking to good for the Milan
from where I am sitting.

The Milan has none of those things going for it.

I don't like Mac's, but if you're going to bash Apple for it's market
performance it's somewhat hypocritical when your own platform has virtually
no marketshare to speak of.

Regards,

Clockmeister.

I sure hope soo...When the financial types say nice things I get worry...The jinx factor. When bad press comes, I feel a sign of releif..Sort of reverse. This has been the saga of aapl.

>   I think the thing that has REALLY triggered the current problems are

Or could it be that the new iBooks and iMac 350 did not ship until late into Sept to make an adverse impact on sales? Apple used Q4 to dry out the iBook channel according to reports...

What do you expect from Beta. There will be plenty of software at roll
out time by than. A lot of the Unix and Linux crowd have begun to develop
shareware.

Were are the dealers dropping like flies?
Mac magazines in general have not gotten thinner except for
MacWorld..Thats due to their own fault and the internet. MacAddict has
grown and so has MacHome.

Have you seen Computer Shopper and PC Magazine lately? Both weigh ounces
not pounds. That has to do with the changing market and the internet...

See macsurfer.com and get a clue!

sinclap,
you must try and control your anger.
i run my business with small compact code machines(atari)
apple used to be the same way.
the consumers that you say you know so well are not impressed with what
they see, this is not a attack on apple, but constructive criticism.
if they were apple sales would not be tanking right now, and they are.
i am not gloating over this, i think that its bad for whats left of the
real computer community.
if you do work at comp usa, or are a apple rep, you would be in real
trouble right now, i have worked for some of the biggest retail corp.'s
in the world, and you always listen to constructive criticism, and you
do not answer people like you do.
i would never dream of doing what i have seen you do over the last
couple of years, my boss would have found out sooner, or later(and that
was before the net), and i would have been canned.
i now know for sure that you are either a adolescent, or very immature,
you could not possibly be in the position that you claim, and i will
find out, i have many friends in the computer industry in the mpls./st.
paul area that i have met, and dealt with over the last 17 years that i
have been in business, i know 2 very good apple people who are small
dealers, but know just about every apple person in the 5 state area,
plus wholesalers of software including apple who have sold to comp
u.s.a. before.
i will find out if comp u.s.a., or apple would allow a person like you

to terrorize a community of users who by the way might become, or are
actual apple customers.

Ok, it would appear that a lot of the people replying to this plan are doubters that such an idea is even sane, not to mention even remotely desirable. But I ask you this... have you "given up the ghost" because you feel that we as end-users/enthusiasts/developers have NO power above and beyond the corporate structure?

This isn't the case, as many believe. Money oft talks louder than screaming, amazing as that seems. And we all have money, regardless how much or how little. We need it to deal in this world. So, this concludes that we:

1) Can do something about reversing Atari's demise.
2) We have financial resources with which to do that reversal.

And what if you haven't "disposable income" with which to aid? Are you a programmer/developer? Are you a good pitch person, able to rally the troops? Everyone in the Atari camp CAN help, one way or another. There's no excuse, except your own belief that we, as users, can't possibly change anything. That history (and the actions of the idiot Tramiels) is unchangable, so we just have to adapt or move on. And that's wrong!

I present a question...

Does anyone know how much Atari was bought for by Hasbro? Was it $5 million? $10 million? $20 million?

This is where things begin...

I present to you an even more important question:

Why are you not already importing Milan and Hades by the dozen?
Why are you not helping Rodolphe develop his Phenix and Rio Red?
Why are you not putting your money where your mouth is?

THIS is where the Atari of nowadays begins.

You're talking of working with this present situation. I refuse to do that. I refuse to accept the death of Atari as absolute. I refuse to accept that the best we can have are the lesser clones of the Falcon or whatever. I refuse to believe that we can't possible change what was done if we simply team together towards a common goal and try hard enough.

Besides, I have absolutely NO disposable income, nor will I, for the forseeable future. Credit cards and married life have taken my thousands and made them required for supporting a family. So, how do you propose I do of which you speak? Rob a bank?

How can you call them "lesser" if you never tried them?

_I_ have tried both the Hades and Milan. I _know_ they are very
good machines and every bit in the Atari tradition, even up to
what kind of "bugs" or limitations they show.

You apparently have no clue what you are talking about. You are
just cluelessly reminescing the "good ol' days of the ST."

According to a gaming magazine I just read, Hasbro *ONLY* paid $5 million
for Atari's entirety. This now means that a buy back is NOT outside the
realm of possibility. Afterall, the computer devision surely is only one

small fragment of the whole, no?

I'm not kidding.  That's what it said!  I'd scan it in and show you, but
haven't a scanner these days.  As far as the rest of what I said, I'm making
an assumption that the computer division would be but a small part of
everything that Hasbro owns of Atari.

No-one is going to want to flog such a dead horse.
Not only that, all that remains of Atari is the name - there is no "computer division".

No-one cares anymore. There isn't anything you can do on an Atari that can't
be done better on a PC so why would anyone bother.

You're in La-La land - snap out of it!

But there could be an Atari computer division and I really do not thing the horse is dead.

I do not think Jared means lesser quality. I am sure even he understands that a 68060 computer is better than a 68000 computer. Lesser means not having the Atari name on it.

Sure, there could be an Atari computer division but not flogging Falcon

based technology which for the masses _is_ dead. That would include Milan
and Hades, although if brought up to speed with current technology there
would be a reasonable chance of finding a some mass appeal.

Ofcourse, that doesn't mean the current stuff is worthless or useless to
the Atari fans. (Unlike older PC and Mac junk)

You're dreaming. Hasbro has added their own value to that pricetag;
further, they would have to be convinced to sell it at all. If they
were agreeable, it would cost a hell of a lot more than $5M, but I
guarantee they would not be agreeable to you, since I'm guessing you
don't have that kind of money anyway.

> Afterall, the computer devision surely is only one
> small fragment of the whole, no?

Computer division? What computer division? Hasbro bought the Atari
name and its properties - there are no "divisions" of any kind.

That's melodrama.  They have product and inventory, not to mention
properties that are seeing a resurgence in popularity.

>         Of course Hasbro might have different ideas regarding the
>         value of the trademark.

That's exactly my point.  Besides, the property is a viable means of
future income.  Why would they even be interested in selling?

Atari is gone.  Anything that comes along to restart it will resemble
the original Atari in name only.  I understand nostalgia - get it all
the time myself - but I don't understand the futile attempts at building
virtual time machines.

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine sticker (17K) or a Banner ad (5K):

Sticker ... http://adbusters.org/magazine/30/nader/tweedles.jpg
Banner http://adbusters.org/magazine/30/nader/Tweedles.gif

===

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Old news. URL to a US government web site that keeps tracks of
all trademark changes was posted here, back when Hasbro bought.
Raw details of exactly what was included in the deal were found
in that document.

In any case, Hasbro wanted Atari only for the fame attached to
the name and to ride the "back to classics" wave by resurecting
Frogger and Centipede in 3D using the Atari name.

I just read that Atari Games (owned by Midway/Williams) is no more and that
Hasbro may have been the force behind it. If that's true, it may very well
be unlikely I can achieve my dream, since this would seemingly indicate they
want only one "Atari" for their own purposes. *sigh*

People want their TOS computers, right? They want their slots, right? They want it all, right? Well, so do we!

What if (the new Atari) computers were simply modified PCs? You alter the BIOS a little, to allow for an Atari splash screen. You have an Atari ST emulator that boots first, unless you press a certain key to go into GEM2000! And since GEM was originally written for a PC, can you imagine how fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not to mention a Pentium II/III, if optimized? Yee-haw!

Sure, you could more or less do that already with a PC today, but assuming anyone cared about the BRANDNAME (unlike most people here, it seems), it still wouldn't be the same.

We would have affordable, already-made PCBs with all the slots you want. We modify drivers to work with GEM for the cards we install and... whoo-hoo! We've got Atari computers again, more affordable than EVER, because parts are already available and cheap!

The only thing we need to do is modify: the BIOS, an Atari ST emulator to work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!) on a Pentium-class computer! In fact, if we played our cards right, people might ACTUALLY be able to run their apps on both the ST emulator and the new GEM! But we HAVE to rewrite as much as possible to optimize it for today's PC environment!

Sure sounds feasible to me and a LOT cheaper than trying to build a custom 060 or PowerPC board, plus modify the emulator and GEM to all that stuff. Not to mention the drivers... oy!

Now see what you clone-people have done? You've taken me from my grand classic Atari ST designs to this altered plan where there's very little difference between a new Atari and a standard PC! All in the interest of finding some way of getting Atari back!

I gotta get some sleep... stuff to dream about! Yeah!

Luposian

Please stop cross-posting this thread to every atari newsgroup.

Since you are talking about some souped up ST clone, post only to the comp.sys.atari.st newsgroup, in the future.

Otherwise, if you still wanna pursue the "with the Atari logo on it" crusade, use comp.sys.atari.advocacy, instead.

If you are gonna insist upon caling it american-made, instead of having a global perspective, please use alt.buy.american.

In any case, stop poluting the newsgroup with your nonsense.

If you really want to revive the platform, start by visiting every page referenced on:

Hallvard's Launchpad http://atari.nvg.org/launchpad/index.html
The Atari Webring http://www.webring.org/cgi-bin/webring?ring=atari;list

In other words, do your homeworks first and research the current market, if you wanna be taken seriously.

(Followup-To:comp.sys.atari.st enabled)

It doesn't matter. It's product and inventory. Emotional attachments
have nothing to do with it.

I don't know what Hasbro's financial situation is like, but I do know
that you buying Atari back is a pipe dream.

Mike

     This has nothing to do with emotional attachments.

     That's rather the point. No one with POSITIVE emotional attachment
     associated with those marks care about some bad clone of a cherished
     original.

     To anyone else, the marks are pretty much meaningless.
     As far as 'inventory' goes: it's only worth as much as people
     are willing to spend for it and it's not clear that those marks
     enhance the value of that inventory.

No! What's sad is that MONEY is the motivation for a lot of companies today. Customer relations seem not to be a high priority that make as much money as quick as possible, even more than you need.

So when you put MONEY before PEOPLE, it is a very SAD day! and it does look like the world is that way orientated.

While the Common Market (called the EEC, due to everyone liking initials) have mountains of food rotting, there are millions of people in need of food and are dying of starvation.

Hasbro seem to be buying everything they can get their hands on.

```

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-

All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.

I've heard the annual sale and swap meeting of the Columbus, Ohio, Atari club will be taking place on Saturday, September 9th. Here are some details I've heard about this event:

Time: 9 am to 3 pm (Eastern Daylight Time)

Place: Oakland Park Community Center, 980 Lenore Street.

Location: Use East North Broadway or Cooke Road exits of I-71, northeast side of Columbus.

Admission: $4 per person. (Maximum $8 per family.)

All you need is a standard 25-pin DIN cable, IIRC male to male (plug to plug).

These are dead cheap and are available from most GOOD computer and electronic stockists. In the UK they are around �7 GBP.

I guess I'm in La-La Land too, I still enjoy using Cyberpaint 2 instead of
most of the crap made for the PC. Take a 486DX2-66 or 80MHz computer can
try doing some of the stuff that can be accomplished with a Milan or
Hades060....you'll be waiting awhile...Oh and you'll need that 20GB hard
drive and 128MB of RAM that CompUSA has on sale to do it on the PC.

Rendering on an '060 is slow, as is encoding/decoding MP3's, oh and my webcam won't work on that Atari/clone, or my scanner or my printer for that manner. I like to surf the web and get the full internet experience, with full plugin support.
I kinda got used to going to a local shop for my hardware/software purchases too...

Then again, my PC is over three years old (P233MMX) so I must be overdue for an upgrade which luckily for me won't cost me much, and should keep me going for another three years.

Seriously though, I still amuse myself with my Amigas but to suggest that they can compare to modern PC hardware and software would be rediculous. The situation is even worse for Atari and clones.

Regards,

Clockmeister.

It should if you load up Linux on it. Given that, there's really
no good reason that you couldn't scan, and print and frame grab
to your hearts delight.

While rendering may be slower, that shouldn't be too much of a problem
as you can just leave that in the background as a batch job.

>manner. I like to surf the web and get the full internet experience, with
>full plugin support.

So, are you going to suggest the assinine and proclaim that we should
all be using WinDOS and Exploder to browse the web? (and for computer
use in general)

[deletia]

Personally, I find a computing experience limited to just that to
be highly depressing...

I guess it all depends what you call slow. I have rendered things before
and I thought it went pretty fast. What kind of scanner and printer do you
have?? No problemo with my Epson Photo printer or my Microtek E3 scanner.
My wife has a HP 2100 laser printer and my Hades/NVDI run it just fine.
WebCam will not work on Hades/clone that is true because no driver exists.
I would agree that if such a driver exists, it would be slow. Still, I
would love to give it a try.

>Regards,
>Clockmeister.

For the most part I agree, but then I disagree. Programs like Calamus
compare very well to most DTP programs that exist for the PC. I am still
happy with my computer and would not switch for any reason...

Then what's this BULLSHIT about "full plugin support". The only
OS variant that can ensure that is WinDOS & quite possibly only
WinDOS+Exploder.

The number of available plugins for Linux, BeOS or QNX is miniscule.

>
>Depending on what your specific needs are, the benefits may not outweigh the

Yup, dont mind Linux. I have a copy of BeOS and OS2 I will give a whirl in the future. You know when the make some things too easy it get's a little boring. I love my Falcon:-). It dosent argue, it just does as it's told. Windoze has a habbit of trying to predict your next move and cock it up.

Windows is kind of an extension of Bill's personality ;-)

I haven't bothered to customize Windows because to me it only serves as a tool for doing some of the things that I like to do, and that aren't available (or as well supported) on other OS's/platforms.
 I like my Amiga (and other PC OS's) for customizing and tinkering, it's just more fun...

Regards,

Clockmeister.

So The iDiot Forever Known As Sinclap was rejoicing over the fact that Connectix has supposedly prevailed over Sony in the infamous Virtual Game Station case - and had thought that it had meant a major death blow to me.

Well, it turns out that as he and Connectix did their little jig of joy, the bear, which was not quite dead, turned around and swatted them upside their heads.

In other words, Sony has re-filed all of its patent infringment charges against Connectix in court, and in such a way that this time they will stick. It also turns out that in pulling out those charges that there were still two that were on the table - which means that THE CASE WAS NOT AS DEAD AS TiFKAS THOUGHT IT WAS.

It's a real sad time to be TiFKAS right now - his Corel stock has shot through the floor, the iMac has disappeared off the radar screen regarding sales, the non-vapour Milan II is going ahead with development with more and more developers in Germany jumping on the bandwagon, his support for Mike Harris as a weapon now faltering since Mike's Uncommon

Nonsense Revolution has come off the rails thanks to the events in Walkerton, and Particle Salad and Brian Van Tilbourg have continued to give what little is left of TiFKAS' butt a solid kicking using the one thing that TiFKAS really hates - the truth.

As for me - doing quite well, here in what the United Nations have once again, for the seventh year in a row, called the Number One best nation to live in on earth for quality of life. Indeed, life has been so sweet as of late that I've decided to take a much-deserved vacation in less than two weeks.

The place - New York City.

The event - MacWorld Expo.

Yes, that's right, MacWorld Expo. I read about the free tickets to the exhibition there and applied, and got one.

Which means that there's a good chance that I'll be coming face to face with TiFKAS himself at the Expo, after all, the little weinerhead has always bragged and bragged about all the Apple-related exhibitions he goes to in his fantasy that he's an "Apple Power Rep".

And you know, if I do see him, you know what I'm going to do?

I'm going to laugh in his face :) And then maybe I'll buy him lunch :)

Maybe even take photos of him, and post them here - I'm sure we're all dying to know what an Internet troll actually looks like in the flesh.

Oh Christ! I've just eaten lunch Dan! Did you need to say that? The very thought makes my stomach do hulahoops! Cindy Crawford (and maybe Milla Jovovich!) but NOT sinplop! The internet doesn't deserve (or need) that!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ Falcon030 owner.

PS. The lunch offering is a nice idea! Sinplop might need a little energy to face the reality!

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not

get a replacement and that I had to ship it across the country to be
"repaired" (and we all know what that means...) - with a three (3) week
turnaround. Assuming that they keep their 3-week commitment, with
shipping both ways, I'd be without the use of the unit for at least
five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship
you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an
obligation to scale their service facilities to meet demand. To not do
so is an indication of their lack of commitment to customer satisfaction
and an unwillingness to stand behind their products.
-
Buyer be ware!

Thats what happens when you are flushed with cash and don't know what
to do with it...Why not use the cash to bring the Jag back...-)?

> It's a real sad time to be TiFKAS right now - his Corel stock has

> shot through the floor, the iMac has disappeared off the radar screen regarding sales, the non-vapour Milan II is going ahead with development with more and more developers in Germany jumping on the bandwagon, his support for Mike Harris as a weapon now faltering since Mike's Uncommon Nonsense Revolution has come off the rails thanks to the events in Walkerton, and Particle Salad and Brian Van Tilbourg have continued to give what little is left of TiFKAS' butt a solid kicking using the one thing that TiFKAS really hates - the truth.

I sold the Corel at the highs..sinclap made a handsome return oly to be eaten by capital gains since I held it for less than a year.

The iMacs have done well according to press reports, that inventory is pretty much flushed out of the channel.

> As for me - doing quite well, here in what the United Nations have once again, for the seventh year in a row, called the Number One best nation to live in on earth for quality of life. Indeed, life has been so sweet as of late that I've decided to take a much-deserved vacation in less than two weeks.

Must of been exhausting in selling barbeque grills..

> The place - New York City.

sinclap will be in his comfty bed watching CNBC and monitoring the web sites on the patio.

> The event - MacWorld Expo.

Been there done that...! Went to the SF show..

> Yes, that's right, MacWorld Expo. I read about the free tickets to the exhibition there and applied, and got one.

Congrats..Will there be a Milan booth?

> Which means that there's a good chance that I'll be coming face to face with TiFKAS himself at the Expo, after all, the little weinerhead has always bragged and bragged about all the Apple-related exhibitions he goes to in his fantasy that he's an "Apple Power Rep".

you might run into the East Coast Team...They will be there in force...

> And you know, if I do see him, you know what I'm going to do?

Offer a Sam Adams?

> I'm going to laugh in his face :) And then maybe I'll buy him lunch :)

No..You wil cry...Once you see how handsome sinclap is compared to 'Chunks'! I will buy the lunch and booz...-)

> Maybe even take photos of him, and post them here - I'm sure we're

I had heard that. The Lynx does perform well. That is I own 3 and am
considering getting another one.

>On a more serious note, how is the Milan II situation going?

No sure really. I see alot of nice thing are coming out for it and you see
"Milan" everywhre on Atari websites. That did not happen much with the
Hades.

I bought an Atari Lynx last week. It's a nice piece of work, leaves the gameboy for dead but...

Then I read it was designed by two of the original Amiga design team.

That explains why it's cool, despite the Atari logo.

Ok, consider this a wake-up call - or is this group dead?

:-)

On a more serious note, how is the Milan II situation going?

Regards,

Clockmeister

The reason is that I have two kids and little hands love to break things.
They do not touch my original Lynx, but the Lynx II is fair game.

I think you might mean an adapter which allowed us to play Lynx games on
TV. I though that was done and would be selling for around $200. I thought
Wizztronics was putting that together.

Well they need to make it more available. There was suppose to a US
distributor, but I think that deal fell through.

Naturally, because 3 is an odd number. Out of curiosity, why would you want
more then two? (given that two units can be linked for multiplayer games)

I distinctly remember a TV adaptor (not modulator, which did exist)being
advertised here in Australia. It allowed TV to be watched on the Lynx.
 I know this to be technically impossible given the relatively low
resolution of the LCD, and apparantly such a device never made it to market.
Must have been bogus advertising presumably.

i have watched you with humor slamming atari, when apple was just barly able to stem off the gatesopoly who vowed pc or else.
apple got lucky with the return of jobs who would not back down, and our stupid, and always to late to the draw government helped apple turn around, but they are not clear by any means.
the super rich never give up.
anyways i plan on buyng a milan II when it becomes availible.
i live in mn. and i go to comp u.s.a.'s all of the time, maybe we will meet someday.
my son bought a g-4 mac there, i wanted him to own something non pc, he started out on a atari 130xe.
he likes the g-4, but like me he also understands that apple cannot do this on there own, and heathy minor competitors from the atari, and commodore era well help expose the average user of computers that there are alternatives including apple.
you should be happy for all non pc users that we have alternatives.
apple cannot be every where, and having 2 more minor players can only help the average person who usually is just above the dim whit stage to question the powers that be if they happen to stumble upon a non pc computer that really is a computer that works,
thanks,
lance

Amiga and PC user actually, but I do have an Atari Lynx ;-)

I know of at least two people that use Atari's in the Perth metro area, so you're not alone.

No, this ad clearly displayed a TV addon gadget with a telescopic antenna
and tuning dial. It even showed a TV picture on the screen, but that didn't
look real. It must have been a vapour product.

Are there Hades distributors active in North America and elsewhere?.
If there are, you'd think they would distribute the Milan also I'd guess.

I need more then a colourfull box to convince me though. I don't want to be stuck having to drive for miles to check out some software titles and having a limited range. Nor do I want to use a lame OS.
I could run Linux, but I can do that on a PC for half the price - and better.

Apple have carved themselves a niche market - The iMac for the newbie/bubblegum brigade and the G4 workstations for graphical workstations and such.

Neither of those niches are relevant to me, so the PC is a far better solution at this time.

Regards,

Clockmeister.

Boy, they blew it big time..

Once again, they forget about the professional audio or video user who needs six PCI slots..

The cube? Great idea.. IF they made an optional 6-slot PCI expander. They don't. Stupid. No fan.. what could be better in a recording studio, right? Except.. THERE'S NO PCI SLOT for your pro audio card.

Oh, you'd like to hook up your CD player to the cube and record? Sorry.. there's no audio inputs and outputs either, though we'll throw in a USB speaker system.. I hope you like the way it sounds. Of course, it doesn't matter how it sounds, because it LOOKS COOL. Real smart.

They couldn't get enough faster G4 chips, so they release dual processor Macs.. nevermind that no current applications or operating systems can take full advantage of them. Very few apps can make ANY use of that 2nd processor.

Oh, by the way, you like our new multiprocessor G4? You have to buy a NEW Apple monitor to do with it. You already have a nice monitor that you bought from us last month? Sorry, maybe someone will release an adapter.. there are none available right now.

Believe it or not, there are many video professionals in the world who like to CHOOSE their own compression codec, and NOT be limited to the 5:1 compression of DV. THEY NEED PCI SLOTS TO PUT VIDEO CARDS IN!!

Apple is now a consumer products company, not a company who is building machines for professionals. Yes, Macs do meet the needs for some design professionals, I agree, for the most part.. but FORGET about audio, video, and multimedia professionals. Maybe that's smart.. sure there's not as much money as there is in building pretty imacs. BUT.. if you want to be the company that "thinks different(ly)," give creative professionals the tools they need to get the job done! Damn, I'm glad I kept my 9500.

So rah-rah back under the rock named Steve Jobs you're hiding under. Unfortunately, the rest of us can still see what's going on in the world.

     Actually, the sorts of 'power' you are talking about
     is strictly restricted to PDA's and embedded controllers.

     There are PDA's with as much RAM and more powerful CPU's
     than the little system you just described.

     Also, I wouldn't be surprised if those PDA's have more
     rendering potential in their CPU's than a Riva128 would.

A fellow MN here...-)

According to the financial types on Wall Street, Apple is out of it's
turnaround mode and is now on the growth mode. Just signed up Circuit
City, the Whiz and Wolf Camera.

Commodore and Atari are out of business so they are not healthy minor
competitors. Many of the users have moved on such as yourself.

Apple is almost everywhere but will not over extend last time. The
Cube has drawn a lot of enthusiasim in the retail scheme of things.

Will be in CUSA locally for the week and IA next week.

If you think about it, do you think the Milan040 is anything but an Atari crust pie with PC filling? Not me. I'm talking about bringing back the Atari TYPE! All-in-one design. Maybe even the styling, like the original 520/1040ST or Mega ST's. Besides, if you want to talk about speed, the Milan040 processore is equivilant to the i486! Of course there are more powerful systems out there today, but power is NOT everything... preference is! Why do you think some people are still using their ST's and Falcon030 or other ST-clone systems... because they LOVE them! That's what makes a loyalist...

You are one who has moved on to another system/OS and left the past dead, accepting fate as unchangable and have no desire to try and see if the dead can be reborn. We need you not!

They're not competitors at all! But if people would get off their duffs and help make this dream of Atari's rebirth possible, the name Atari could be at least as powerful as Be! I want to help put Atari where is SHOULD/COULD have been, not where it ended up thanks to the Tramiels.

By the way, after JTS went under, where did those low-lifes (the Trams) go? Where are they now? I'd like to kick them in the head for what they did to my favorite company.

Now - that - would be a helluva machine - updated TOS in ROM - with at
least 32 meg of Ram, a 4 gig hard drive, flat panel display, and a
couple of USB ports - and able to use well designed Atari 'no bloat'
software like Pagestream, That's Write, Papyrus and so on - I'd buy in
a flash !

And, I'll still not hold me breath !

4% or so of a market is only hanging on by a thread.
they are coming out with some cool stuff, but they cannot do it all by themselves, they need other platforms also to genrerate non pc software houses who will write real software that takes advantage of real architicture, so that the average user can really see/appreciate what a real computer can do, not bloated pc port overs.
and although atari, and commodore are out of bussiness, what i mean is there platforms.
many cool small companies went out of bussiness that wrote software for non pc platforms, and they survived by writing software for more than one platform, thus giving all a wealth of choices that you do not see in the modern pc driven stores, only bloated bug ridden stuff you see today.
i run my bussiness on atari 8-bit computers, i have a data base of over 10,000 customers, and many 1000's of items, all on cool software written many years before the pc could even do it.
i use a mega st for games, and desktop publishing.
i will use the milan for the net.

Yea, just like when they released the multiprocessor 9500 180MP.. TONS of dual processor apps coded.. NOT.

Still, there are many applications that do not use Altivec too. Apple is making developers once again redo their code.. OR wait for OSX to redo their code once. What do you think they are going to do? Right, redo their code once. It's stupid to release a multiprocessor machine without apps that will take full advantage of it.

> > Oh, by the way, you like our new multiprocessor G4? You have to buy a NEW

Er.. you DID know I wasn't talking about the cube, didn't you twinkie? The NEW multiprocessor G4s.. do they have both VGA and the new connector?

> > Believe it or not, there are many video professionals in the world who
> > like to CHOOSE their own compression codec, and NOT be limited to the 5:1
> > compression of DV. THEY NEED PCI SLOTS TO PUT VIDEO CARDS IN!!
>
> Then get the G4 Tower...

Er.. twinkie, one more time, do the math:

agp slot: video card 1
pci slot 1: video card 2
pci slot 2: SCSI card
pci slot 3: video card

Where do I put my pro audio card? Where do I put my 'ice' card for Media Cleaner?

Or for the audio workstation, where do I put my dsp farms?

DON'T even talk about capturing to firewire or to the internal IDE. Internal

IDE drives might be fast enough, but there are no IDE DLT drives for backup, so I need SCSI anyway... and firewire drives are not currently anywhere near fast enough for uncompressed video.

Rah rah rah.. I just wish they'd make a new machine for pros.

I am going to construct a website dedicated to the rebirth of Atari and the computers it made (and will make, if I and others have anything to say about it!). I'll report when it's ready to visit.

Who would buy this new reborn Atari box at these obsolete specs? The
new box would have to attract new users to prosper instead of living
off its dwindling base. Apple knew this, thats why the iMac was born.
Bringing new users to the platform. The new $799 iMac will continue to
drive the userbase and marketshare. I do not see the Atari box doing
anything..

Apple's consumer marketshare is increasing and will double soon by next
year now that another retailer is on board...Circuit City with 550
stores. At MacWorld NY, there was hardly any spare floor space. Lots
of small developers were there showing their wares. Apple's foucus is
retail with iMac and iMovie II.

I never said it wouldn't sell. I said, once again twinkie, that Apple has
neglected
audio and video professionals. I said, the cube could have been a solution. I
said, Apple is now just a consumer hardware and software company. I said they
could
have had a KILLER machine that would make a lot of people happy. Instead, they
have
good machine that will make some people happy. I suppose that's good enough for
twinkies like you and Jobs.

Man, you are an imbecile. I, and most audio/video professionals, need more than 6
pci slots. Clear enough for you?

> > Yea, just like when they released the multiprocessor 9500 180MP.. TONS of dual
> > processor apps coded.. NOT.

Oh yea, the new Apple.. the one that releases new technologies way before they're
ready..

> If you don't release a dual processor machine then the apps will not be
> written. Next.

Er.. imbecile alert again. If they release an OS that takes advantage of dual
processor at the same time they release dual processor machines, THAT makes sense.
It makes NO sense for Apple to release these machines before then.

> > > > Believe it or not, there are many video professionals in the world who

Imbecile alert III. Slots two and three are already filled, twinkie.

> > Or for the audio workstation, where do I put my dsp farms?
>
> A PCI expansion box. Next

Right.. but ask about how much luck people have had with expansion boxes on Digi's board. Ask if they can put a video card there.. or a SCSI card.. or some other card. It's hit or miss.. it's a kludge, twinkie.

> > DON'T even talk about capturing to firewire or to the internal IDE. Internal

"Yea, right?!?" That's the Sinclap moron response when there's a point you cannot refute. Firewire drives are NOT fast enough. What is the fastest currently shipping firewire drive? Do a little research and get back to me.

>Who would buy this new reborn Atari box at these obsolete specs?

Those who want one and no one else.

> The new $799 iMac will continue to
>drive the userbase and marketshare.

Sure it will.

> I do not see the Atari box doing
>anything..

Yeah, and you don't understand why some people still use a 15 year old computer.

Regardless, while I like alternative platforms, you do an excellent job putting me off Apple Computers and get me even more interested in Ataris and Milans.

Keep up the good work.

Microware is still maintaining OS/9 and they're giving out eval CD's (www.microware.com). 68K is still on their list.

An 030 can still address quite a bit, so I don't see how that
could be an issue. There were people running 100M+ TT's back

```
     when RAM was $50 or more per Meg.

     It's enough of an OS to get 'common' work done.

[deletia]

An A2000 isn't an Amiga?. It served it's purpose as my main computer until a
couple of years ago.

>Licensing scheme?

IBM wanted a substantial royalty from any manufacturer that produced/sold systems incorporating MCA. A royalty on _every_ computer sold with MCA in fact.

Most manufacturers, with a few exceptions, decided IBM could stick their royalties and the MCA bus where the sun don't shine.

Regards,

Clockmeister.

So the Pathetic Pseudo-Apple Salesman the 'Clap has been parrotting the tired and untrue claim that the G4 is "Twice As Fast!" as its equivalent Pentium III? Think Different.

...why does it cause so many problems for people?

The APA has a study that claims to show a link between playing video
games and violent behavior. Upon reading the thing you notice that
they only tested people using a Mac. Could it be that using the Mac is
what caused this increase in violent behavior? I know the few times
I've used one its so-called 'intuitive' GUI struck me as the most

illogical thing I've ever seen and nearly drove me 'round the bend.

The relevant passage is:

"For the first session, participants were scheduled in pairs to come into the laboratory for 1 hour. Upon arriving at the laboratory, each participant was escorted to a cubicle that contained an intercom and a chair facing a color Macintosh computer equipped with a voice key (MacRecorder) and a pair of headphones. A female experimenter asked each participant to read and sign a consent form, to read a brief overview of the study, and to familiarize themselves with instructions that explained how to play the video game to which they were assigned (either Myst or Wolfenstein 3D). The experimenter then informed the participant that she would contact them when she was ready to begin and closed the door to the participant's cubicle."

The full text is at:
http://www.apa.org/journals/psp/psp784772.html

Could this be real cause of the drought of games for the Mac? Are Game makers just being socially responsible?
Cuss and discuss.

Mac X public beta will be here summer time most likely at MacWorld in
July...Nice try!  Lets see...What did Apple release this year in terms
of hardware and software?

The G4's drive the margins that fatten the profits.  What does the
clones have to do with the no show of the Milan?  The Mac clones are
old news...

some news on the upcoming Milan II.

Perhaps the 'Clap, who is obviously simmering after the one-two-three punch of no Mac OSX this summer, iMac sales tanking, and one of his mortal enemies getting a web site job, will now do the honorable thing and flush himself down the crapper along with his now-worthless Corel stock....

Hello,
Received a flyer today with news about the Atari/Amiga expo in Neuss. I quote :
The new Milan II will definitely be presented on a 60m2 stand.
The national and international press will be present as well as the TV (there will be a 8
minute WDR broadcasting about the Milan on June 10th.
Besides the presentation of the Milan II, there will be many new Milan II goodies : new
comfortable System-Manager, Resolution-Switcher with integrated Themes-Manager, new
glow-Icons and more.
If the system sells well, computers with integrated TFT display, Milan based Web-Pads,
Tos compatible Pocket organisers will follow.
Presentation of design-studies for the next generation Milans (PPC ?)
Presentation of the new Milan HDrecording software "Take".
Bubbles will be the new official Milan screensaver.
New version of CD recorder 3
Introduction of the "Papyrus killer" : Tempus Word 4.0 (scanning integrated)
etc.......etc......etc........
Also sensational Amiga presentations !

See you in Neuss
Dan

Milan 040 - Magic Milan

and now, some reactions to this: which will further dilute the 'Clap's noise pollution. (of course, this can be miminized if he gargles with Drano....)

Hello Lyndon,

>>Besides the presentation of the Milan II, there will be many new Milan II goodies : new
>>comfortable System-Manager, Resolution-Switcher with integrated Themes-Manager,
>new
>>glow-Icons and more.
>
>Glow-icons?! - sounds smart anyway

They were shown in the German mag STC. They look nice and start to "glow" when selected
If Milan wants to sell to new customers, the looks have to be good.
>
>>Bubbles will be the new official Milan screensaver.
>Bubbles is ancient isn't it?

Maybe it has been updated ? I'll try to find out.

>>Introduction of the "Papyrus killer" : Tempus Word 4.0 (scanning
integrated)
>Well never tried Tempus (own papyrus). It must be good to beat
>Tempus.

You can download a "pre" version at http://www.tempus-word.de
After years of silence the development of this well known word processor
software (in
Germany) is continued. I heard a rumour that it will be translated in
English. It is said
that M$ took it as an example for it's wordprocessor.
>
>>Also sensational Amiga presentations !
>Hmm yeah OK. I think the Atari side will will win people over.

I hope it doesn't end in a riot between Atari and Amiga users :-)
>
>
>>See you in Neuss
>I wish I could be there :-(

I'll try to make a report on this newsgroup.
>
>I would be great to see Atari back in the press for the right reasons.

The TV broadcasting of 10-6-2000 will be shown as AVI or another format
(if the WDR gives
permission) via Karsten Schaefer's site :
http://www.geocities.com/karsten_schaefer/milan_e.htm

Cheers
Dan

nope, no Tramiels to screw things up.

Meanwhile, Mac OS-X is late again (as usual), they're promising double-processor G4 systems without giving a firm release date (as usual), and TiFKAS is still parrot-sheeping the Jobs part line without having a single independant thought in his head (as usual)....

>
> A pipe dream!

and what has TiFKAS been smoking? He's claiming that Atari is dying, and yet the success of the Milan project has him wibbling on and on in full damage control mode.

In the meantime, there's been a lot of news on the software development front. Papyrus Office is out NOW, and in an English version to boot too! Tempus Office is out NOW. Word is that Milan's going to be showing off a new CD-ROM recorder package at the launch, it'll be cool if it turns out it's bundled with the computer....

hmm, interesting. Someone else has taken it upon them to take the mantle of "Chunks" and and use it to bludgeon TiFKAS with. How interesting, indeed.

BTW, TiFKAS, reason I haven't been replying as of late is that I've been busy selling BBQs with the store. And I'm reaping the benefit.

Don't you have a mommy and daddy who gives a rat's ass about you? If they did, they would install Net Nanny on your computer.

But then, I guess the Mac Community doesn't care about you, either....

well, if it's out in Europe, them it's not "vapour".

Now, on the other hand, those dual G4 Macs that were promised for release, with no set date and are nowhere to be seen ANYWHERE on earth, is the very epitome of "vapour". Not unlike the methane-like smell that emulates from TiFKAS' mouth whenever he speaks his mind.

<snip>

ironic that TiFKAS is posting this mindless drivel as usual, while at the same time MacAddict Magazine (a magazine TiFKAS hates because they won't kiss Steve Jobs' ass) has posted some very really different results when putting a G4 up against an Athlon 1GHz machine. Even they were honest enough to admit that the Athlon was better at many of the tasks in Photoshop than the G4, and it was only with the Velocity Engine that the G4 had a slight edge over the Athlon.

MacAddict tells the truth. TiFKAS the prevaricator and useless troll has been known to make things up from whole cloth. Who do we trust?

Oh, and speaking of which - it seems TiFKAS, who has crowed long and loud about how "Newsreaders Are Obsolete!", is also a hypocrite. Looky at what I found in the header of the message I'm replying to:

```

              ^^^^^^^^^^^^^^^^^^^^
```

what's wrong, TiFKAS? Did Deja give you the old heave-ho because they found out you were using their service to scrawl your childish drivel on our walls? Or did it turn out that Deja was not as "perfect" as you thought? Or were you too cheap to register with Deja?

BTW, TiFKAS - YA NewsWatcher is now at version 5.0.1. What's wrong, can't your "superior" Mac run this program? :)

no, that you actually have an OPTION, pinhead! As it has been stated
in the Milan master plan, a Linux port has always been planned for the
Milan II. Compare this to the Mac, where Apple actively prevented BeOS
from developing a version of their software to run on G3/G4s. Jobs
afraid that Be would show up how bloated and buggy Mac OS 8/9 has become?

>
> >   The 'Clap is a disease - and the truth is the cure.....
>
> Just stated a reason not to wait for vapor.

Milan II is not "vapour". The dual processor G4 tower Apple is promising without setting a date for release is the epitome of vapour.

Oh, is the Milan II "vapour" because they set the date of release back? Happens all the time in the industry. By TiFKAS' own yardsticks, Mac OS-X - promised "this summer" and now set back - is the very epitome of the definition of "vapour".

and, according to TiFKAS yardsticks, any '040 Mac is "junk".

Or, funny enough, the G3/G4 is now officially "yester-decade technology"....

ahh, but they only ruled on 9 of the 11 charges. Which means the case is still active.

but, of course, it all boils down to the fact that TiFKAS, who claimed that Sony would be doing a licencing deal with Connectix RSN, has failed in his prediction.

And the fact that Connectix must be losing money hand over fist - in light of the fact that there are STILL stores stuck with the original release, now selling them at fire-sale prices well below the MSRP, isn't helping.

oh, and BTW, Bleem is now being officially sued by Sony.

ah, but it does. You see, I know Bruce. He's a knowledgable guy, and he knows what he's talking about regarding his MIDI work and projects. He's also a keen gearhead. He also knows who's acting like an ass and who isn't

Compare this to TiFKAS, who has constantly had his ass handed back to him on a platter with a side of mint sauce by pros like Particle Salad and Brian Van Tilbourg whenever TiFKAS tried to bluff his way through topics he knows absolutely nothing about.

TiFKAS will only start to have the smallest shred of credibility when he reveals who employs him, who his supervisor is, and the number where said supervisor can be reached. Or are you afarid the "Atari Jihads" are "out to get you", COWARD?

The Hades runs Linux just fine except you must boot it from TOS in the 256 color mode. I hear that it is possible to change the video mode to 32k, 64k or 24-bit. I am looking into that now. I am wondering if the Linux version for the Milan ii will be any different. I am thinking on getting a Milan, but will wait to see how things go. The Hades is serving me well and I am in now hurry to switch. But if I did, I would still keep the Hades and use it mainly for Linux.

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

So...Mac OS8/9 get the job done. I was hoping BEOS would take off on
the intel platform. From the looks of it...it has not..

Apple did not publicly show it..Was a private affair at a Developers
Conference...Big difference...Is that the best you can do?

>   Oh, is the Milan II "vapour" because they set the date of release
> back? Happens all the time in the industry. By TiFKAS' own yardsticks,

It happens all the time? NOT!!!! Was true ten years ago..However, the
Tramiels gave the new meaning of vapor and has continued to do so
today..

Why the difficulty in releasing obsolete technology?

Mac X beta will be released to the public this summer...Most likely by
MacWorld..

Not the issue here..Ducking it I see. The whole package cost a $1 to produce. Connectix would make money at $10..

>   oh, and BTW, Bleem is now being officially sued by Sony.

So...

Apple did not promise a release date nor did it set one. You must of
read the rumour web sites again as truth..

They showed a prototype at a proper venue..

First of, the reported drop off in iMac sales is not tanking. Were talking upto 30,000 units in the 400,000 range..Plus the current line has not been updated since last October. You failed to mention booming sales of the G4, PB G3/2000 and iBook line.

Second, the web site is pathetic. No original content...just parroting the others...Plus your no Rodney O' Lain!

Third, I sold the Corel Stock went it went to $40...sinclap is no dummy..The only disadvantage is the capital gains..

Mac X beta will be out in summer time FREE!..Most likely at MacWorld..
Apple showed the double processor G4's to developers at a private
conference.  Did not announce a time table but a technology preview.

Now name all the models and software that Apple has released in the
last year?

Now name all the models that the makers of Hades released in the last
year?

Sound fammiliar?

The 'formal' user group is as dead as Atari Corp - the remnant of the old 'user group' - all friends, users of Atari, Mac, and even PCs of various stripes - still meets once a month to chat about computers, software, politics and what have you.

The BBS is in the same place as the Dodo - extinct !

And I'll still not hold me breath awaiting the Milan on this side of the pond !

The Canadian Curmudgeon (in sunny Calgary, the downtown of which is a 'police state' this week, thanks to the eco-freaks)

What with the bad news about Corel, and confirmations that iMac sales are tanking badly around the world, here's another nail for the 'Clap's cofin, courtesy of As The Apple Turns.

Oh, and by the way, 'Clap, there's a propur definition for "vapor" here, unlike your "whatever I feel it means in my futille campaign to destroy Atari" mumblings:

It's one of life's sad little truths: when faced with a fork in the road, sometimes you make a choice you regret later. And as far as regrets go, Apple seems to have more than its fair share. There's the way they missed the chance to license the Mac OS before the whole world went Wintel. Then there's the way they licensed it too late and in such a brain-damaged, sales-cannibalizing manner. There's the years of development and millions of dollars poured into Copland before the project was scrapped. And most recently, there's the whole move to the G4 processor...

Okay, yeah, sure the G4 is one smokin' little chip. Gigaflops, and all that. Supercomputer performance. Whatever. There are a couple of serious problems, though, that are really starting to bite Apple in the behind. For one thing, that supercomputer-level performance really only kicks in when an application has been written specifically to take advantage of the G4's "Velocity Engine"-- and there are far fewer of those specialized apps than we'd like to see. And for another thing, there's this whole "stuck at 500 MHz" nonsense. We don't care how fast the G4 may in fact be; Apple's getting creamed at the Joe Shmoe marketing level, where Windows systems are available at twice Apple's fastest clock speed.

What really hurts, though, is that while Motorola is lagging with the G4, IBM is quietly cranking the G3 up to ridiculous new levels of performance. Velocity Engine aside, a 500 MHz G4 is reportedly roughly equivalent in speed to a 600 MHz G3. Well, guess what? According to The Register, IBM has just demoed its new 750CX and 750CXe G3 processors, which are expected to hit 700 MHz in the not-too-distant future. Which means it's entirely possible that the fastest G3 might soon be faster than the fastest G4-- and not just in terms of clock speed. (Yes, Motorola is supposed to have the G4 Max out by then, but we've officially adopted a policy of considering any Motorola processor to be vapor until it's actually shipping. That whole "G4 Speed Dump" fiasco was just too harsh a burn.)

So could Apple successfully switch back to G3s in its professional desktop Macs? Not likely; all that hype about the G4 being the future of computing was a textbook example of bridge-burning at its finest. To "downgrade" from the G4 to the G3 would be a PR disaster of truly biblical proportions-- we're talking "ten plagues" kind of disaster. So no, we figure that Apple's going to have to keep its fingers crossed and hope that Motorola can crank the G4 up to the performance level it deserves. If everything stays on schedule (ha!), early next year we may have dual- and quad-processor G4 Max systems running the symmetrically-multiprocessing Mac OS X-- giving customers, say, "1.4 GHz" or even "2.8 GHz" Macs to play with. We hate the "Wait 'Til Next Year!" game as much as you do, but hey, if you've been following Apple for any length of time, you're used to it by now.

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

Irelevant stuff deleted....

You might want to rethink the iMac sales are tanking bit...

http://macosrumors.com/?view=recent

Supplies of current iMacs dwindling in preparation for speed-bump?

Several sources at national retailers including CompUSA, Sears, and the The Wiz have all reported that Apple is either no longer shipping them current-model iMacs, or that supplies are severely constrained. Some locations could not confirm this, but it does appear from quotes attributed to Apple reps that these stores are being told to clear out inventory for a "late July" announcement of a new iMac. As this is precisely the time frame for Macworld New York, the reliability equation on this rumorappears to be steadily climbing toward reality. Stay tuned for more details....

sinclap!

Perhaps you should take a look at the definition of Vaporware.... if it
exists and has been released then its not vaporware, regardless of country.

Its kinda funny really - for some reason alot (not all) Yanks seem to think
that the whole universe revolves around them :)

Matt.

I already have you some names, twinkie. I have a friend who has been making
movies on a Targa 2000-based system for many
years.. VERY mid priced. Are you familiar with the Radius Edit DV?

> > "Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your

> You'll get over it...

Very good, twinkie..

> Pro DV Cameras begin at $2500 for a nice Sony one...Prices are
> falling...

OH MY GOD! There is NOBODY in the industry who would say an XL1 or DVX-1000
is "PRO." NOBODY!! You keep doing it again
and again.. they are fine cameras, to be sure, for the price.. but NOT pro.

I know it's very painful for you to admit it, but you just don't understand
the business.

> > > What G4 problems?

> Just talking out of your arse again...

Give me his email addres and let me ask him.

Better yet, go here:
http://www.digidesign.com/ubb/Forum16/HTML/003225.html

..for a discussion on the problem, including a potential solution (a $700
dual monitor card).

Or here:

http://www.digidesign.com/ubb/Forum16/HTML/004153.html

..for a discussion on the problems with three monitors on an AGP G4,
including an admission from Digi that "it doesn't look good."

All it takes is a little bit of research, twinkie, to prevent making yourself

look more and more clueless.

> v 2 most likely will be ten times more..The beginning of the end of
> > > the traditional tools...
> >
> > Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid?

> > Man, you are
> > FUNNY!!
>
> Just wait and see!

Yep, I will.. it was, what, a year or so that FCP first shipped? Since then,

how many motion pictures were shot on DV and edited on a
FCP system? Er.. that would be none, right?

>

> > You don't have to believe me.. why don't you go to a video lab and ask
them
> > about it?
>
> Sure...

"Sure?!?" Does that mean you actually will do some research into the
industry?

Come on twinkie.. at least respond to the point above. Do you even know what

Radius' product is? Do you know what the
Casablanca system is? Do you know what a Targa 2000 is?

> > I'm sure you are.. you're trained in FCP, but NOT in the workings in the

valuable
> > skill.
>
> You should try your own thoughts...

Again, twinkie, I KNOW what I don't know.. I DON'T make prognostications
about Apple because I don't really know the computer
market very well, relatively speaking. I don't make any predictions about
Adobe Photoshop or Quark or Microsoft Front Page or
Apple's stock prospects or the prospects of OSX or..?!? You get it yet?

Stick with what you know, really.. I'm sure there are some areas where you
are quite knowledgeable.. this ain't one of them, twinkie!

> > I don't buy from someone who is afraid to say "I don't know, I will
check"

Yes, it does take practice. I'm sure you can climb above it if you try...

> > Anyway, twinkie, you forget that I'm in a no lose proposition here.. I
win as
> > the tools
> > get cheaper, I win if Avid fails or doesn't, I win if apple drops FCP..

>
> True..It's the technique. Some have it many do not..I am in the many
> column hoping to get to the some column...Only if I can get the
> photgenic shot of my significant...

Right.. so, again, I have nothing to be "scared" about.. I'm in a no lose
situation. I don't care what tool I use..it's just a tool.. as long as
it's stable, I'll use it..

> > All the G4/FCP systems in the world aren't going to help you make good
video
> > until you
> > know the above.
>
> True...But there are alot of young creative types out there..

Yes there are.. and there will be some great work coming out on these cheaper

systems. I've been excited about the digital
revolution in audio and video for a long time.. even though there's more crap

then ever before, the cheap technology also gives more
people the opportunity to do something great.

BUT..

Do you really think these young people with great ideas will stick with FCP when they get more money? DO you really?

To say FCP is bringing about the demise of Avid is ill-informed, foolish, Steve Jobs hyperbole that has no basis in reality.

You COULD make the argument that the digital revolution is causing Avid to rework their strategy.. of course, it's causing ALL players in the market to do that, but at least that would have some truth to it.

So really.. to put it honestly, your ridiculous parroting of the Apple PR "reality distortion" line just serves to make you sound like a stooge. I really believe you're smarter than that.. against all proof, maybe, but I believe it. Act like it..

> Very True..That was covered in the video media production class. But
> there are lots of creative types out there that can figure out unlike a
> certain 'chunk's'...
>
> > Who will win? I don't know..
> >
> > All your silly predictions are meaningless.. of course, so are mine, except
> > that I, at
> > least, realize it.
>
> The tone in your post does not indicate this..

Right.. but if you're going to invest in a company, would you listen to your grammy who spends 15 minutes a day on etrade and does no research over someone who spends full-time looking, researching, checking out the market? Wouldn't it seem rather ridiculous to hear your grammy comment about something she knows nothing about?

Your comments are so far off and display such an incredible lack of understanding of the market, yet spoken with such certainty, that they need to be debunked clearly and often. This is not about any 'tone' of my voice.. YOU set the tone with your ridiculous post. Do I need to repost it? Oh what the hell, let's just look at the headline of this

thread:

"The new products with the PM G4 and final Cut Pro could be the final nail in

Avid's coffin.."

Is that clear enough for you? WHO among us has actually admitted their limitations in this thread? Me. Who is clear about the reach of their knowledge? Me. You've displayed zero understanding of the limits of your knowledge. Zero.

> > Don't look now.. but once again, you tried to bring the ball inside on
me.
> > This time,
> > you didn't even get a chance to try a shot before I picked you clean,
then slammed it
> > over your head.. are you foolish enough to try again?
>
> Than why are you sweating?

Because I'm laughing so hard, I can't believe you would try yet AGAIN to
score on me. As a matter of fact, I'm laughing so hard I've
gone into convulsions, and I'm sweating profusely.. yet even through the
convulsions, I'm STILL able to stick my arm up and grab the
rebound on your badly missed shot.

Well, it had to come to an end someday... I have to sell my old Atari stuff to make room for other stuff.. :(Fortunately, my Atari will still live on through emulation on my iMac, but emulation ain't perfect.

Anyway, below is a list of what I'm selling. Right now I am asking $250+shipping for all of it. I will consider breaking it up if I can't find a buyer for the entire package. I want to sell to someone who will take care of this stuff and appreciate it the way I did. Reply to this in email if you're interested!

Original Software:
Phasar 3.0 - original box/manuals
Timeworks WordWriter 2.0 - original box/manuals
PC-DItto 3.0
GFA Basic
1st-Word
DB Master One/Megaroids
Space Harrier
Metro Cross
Epyx World Games
Epyx Battleship
Top Gun
Harrier Combat Simulator
12 Computer/Atari ST User/STart! disks

Books:
GFA BASIC
GFA BASIC Training Reboot Camp
Atari ST Internals
1001 Things To Do With Your Atari ST

Hardware:
1 1040STe - 2 megs, TOS 1.4 or 1.6
1 520ST - Half-meg, TOS 1.0 or 1.2
2 SF314 Double-sided double-density drives
1 SC1224 Color monitor
1 Beetle Mouse - may not work
1 Atari standard mouse
(the CPUs, disk drive, and Beetle mouse all come in their original boxes and have the original documentation, as well)

Magazines:
3 Issues of Current Notes (Apr, Oct, Nov 93)
1 AtariUser (Apr 92)
2 Atari Advantage (May, Oct 92)
1 Atari ST Informer (Dec 92)
1 Atari Interface Magazine (May, Fall 92)

PD/Shareware Library:
168 PD/Shareware disks
All programs are archived
Each disk is categorized (Productivity, Communications, Games, etc)
15 Magazine cover disks
The library includes one set of master disks, and then anywhere from 1-3 copies of each disk
The library also includes two bound catalogs
One lists all files in alphabetical order with the disk number they appear on
One lists all the files by disk number order

If all else fails, try an see if you ghostscript supports that printer and if you could adapt it's source to your needs.

Ghostscript is a Unix oriented package that is meant to make any printer

appear to
be a postscript printer. Part of it is a collection of postscript -> printer
translators for a wide
range of printers. There is even an Atari version but I don't know how current it
is.

It is essentially a printer driver package for Unix systems, most notably
Linux. If your
printer is old enough, I suppose the Atari version of Ghostscript would support
it.

It's available as source code, so anyone that needs to could cannabalize it
for use on
another operating system.

Fine..except for the "make money" part.

You keep waiting, I'll be here shooting and editing video, thank you.

> > Sure, for that level of videomaker.. I've never argued that, twinkie.
>
> Bingo! Avid is losing the slice of the pie..

Again, you prove yourself clueless. Avid has never had a big piece of the low end
pie,
twinkie. They have a huge piece of the high end pie.. and I don't think many
hollywood
studios are switching to FCP!!

"Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your editor,
the one
you hire out for thousands of dollars a day, is going to have to work on a new
system
today.. oh, I'm sorry, FCP doesn't support 3D rendering. Oh I'm sorry, what do
you mean
you shot this part on Digital S? FCP doesn't support that codec, and we'll have
to go
analog.."

LOL!

> > Once again, talking out of your asshole. Avid has a low end pro product..

Prove it, twinkie.. don't just say I'm clueless, prove it.

> It's happening...Try the technology section on playboy.com...A famous
> director has begun making his first flick on digital video!
>
> http://playboy.com/digital/feature/timecode/
>
> And your were saying?

I'm at work right and and won't click that URL.. but what codec are they using?
Is it
Digital S? Are they editing on FCP?

"It" is happening, if the "it" you are referring to is digital video becoming more
and
more popular among both low and high end video productions. But, for the tenth
time,
the high end stuff isn't shot on mini DV, twinkie.. and if it isn't shot on a DV
variant, there's no point in using FCP.

In case you don't realize it, there's a big difference between your $800 mini dv
camcorder and a pro camcorder. Does the word "lenses" mean anything to you? How
about
"three CCD?" How about "locked audio?" How about "HD?" Only NOW does FCP even
support
16:9 video!

> Of course, there are problems with those
> > G4s,
> > aren't there? Are you even aware of the problems Pro Tools users are
> > experiencing
> > with them? I didn't think so.
>
> What G4 problems?

Let's see.. MIDI over USB, no update to OMS, and the biggie.. you CAN'T use two
separate
video cards on an AGP G4 without getting PCI bus errors. Everyone in the business
knows
that except you.. but then again, you aren't in the business.. so why are you
arguing
with me?

> > Again, I think FCP is a good program, twinkie.. it works pretty well for a
> > rev 1
> > program.. and is a good choice for many low end editors who shoot on DV. FCP
> > is NOT
> > bringing about the end of AVID any more than Linux is bringing about the end
> > of
> > Apple.. they are different, twinkie..
>
> Rev 2 most likely will be ten times more..The beginning of the end of
> the traditional tools...

Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid? Man, you are FUNNY!!

I don't deny that Avid has and will continue to change their business model due to changing technology.. but so has Apple, Microsoft, and every other tech company, twinkie. Avid has always had competition in the low end from Radius to Targa to Casablanca to Iomega to Apple.. there's nothing new there, except the technology is getting cheaper. Of course, so are Avid workstations. For people who need ROCK SOLID performance, for whom downtime is MONEY out of their pockets, a FCP based system just doesn't cut it.

You don't have to believe me.. why don't you go to a video lab and ask them about it?

> > You are clueless enough to not even
> > understand
> > the advantages of the product you are cheerleading. I hope other "apple
> > power reps"
> > are trained a little better..
>
> We are trained..Like the segment on FCP by the development folks..

I'm sure you are.. you're trained in FCP, but NOT in the workings in the market. I would not hesitate to ask you for FCP feature descriptions and benefits, I'm sure you're well versed in that (I would hope so).

But it doesn't do you a whole lot of good to pretend you know about something, when you obviously don't. KNOW what you know. KNOW what you don't. It's a valuable skill.

I don't buy from someone who is afraid to say "I don't know, I will check" instead of trying to guess. But you have to understand the limitations of your knowledge before you can do that.. you have to have enough self confidence in yourself to try that.. you have to have a little humility for that.

> >
> > LOL! Like I said, get that shit out of here..
>
> Are you afraid that you will be wrong?

Oh, I know I can be wrong.. I've been wrong before, and will be again. I certainly don't have any fear of YOU proving me wrong, though! LOL...

Anyway, twinkie, you forget that I'm in a no lose proposition here.. I win as the tools get cheaper, I win if Avid fails or doesn't, I win if apple drops FCP.. because, as you will soon learn when you get your Canon "out of the shop," it's not really the tools.. it's the knowledge of how to use those tools. How do you properly light? How do you get good audio? How do you edit dialog? How do you do dialog replacement? How do you do foley?

All the G4/FCP systems in the world aren't going to help you make good video until you know the above.

It's just like the pro audio industry, twinkie.. host based systems haven't made Pro Tools, Sonic, Sadie, Otari and above go away. What has happened is people who record in their home studios are now understanding the benefits of going to outside pro studios for certain parts.. and they are getting more work from people who screw things up at their home studio. They are understanding that you still have to know how to mic a drum kit.. you still need to have great microphones and the knowledge that goes with it.
Digidesign has adjusted by bringing out a lower end system.. Avid has delivered a $10k turnkey DV system that it just a little more expensive than a FCP/G4 system by the time everything is added up.

Who will win? I don't know..

All your silly predictions are meaningless.. of course, so are mine, except that I, at least, realize it.

> > Your follow up shot has been slapped up to the cheap seats once again... bring
it
> > on, but you might want to bring a friend with you, because you can't handle me
one
> > on one..
>
> Yea right!

Don't look now.. but once again, you tried to bring the ball inside on me. This
time,
you didn't even get a chance to try a shot before I picked you clean, then slammed
it
over your head.. are you foolish enough to try again?

The "oh-so happening" Amiga platform just died, along with its
last issue of Amiga Format. Most of the editorials and readers
comments go along the line of:

"Amiga changed hands so often that we might as well enjoy what's
already there and not hold our breath for anything new".

R.I.P.

so that well-known Mac Idiot, the 'Clap, has been crowing that the Milan II is vaporware.

well lookee here, here's news of a major new project that will bring the strength of the Linux platform - and its many great applications like Netscape and Corel Wordperfect - as an available bootable option. And companies like SuSE don't develop for vaporware platforms.

The 'Clap is a disease - and the truth is the cure.....

: Well a friend of mine contacted Suse about this, better
: he contacted the right person there and the answer was
: that Suse is working on a 68040/68060 compilation, which
: can be used on the Amiga and Apple plaform, but they are
: going to compile a special Milan II version.

Excellent news! SuSE is my favourite Linux distribution for the PC, structured, logical and comfortable. They're also a *leading* Linux company, in the sense that they develop drivers and add new system features no one else has come up with before. Like support for more RAM etc. For instance, they're the first company to offer it's distriution on DVD. So instead of six CD:s containing SuSE Linux, you only need one.

The six CD:s are filled with 1500 prgs, among them heavyweighters like Netscape, office packs, WordPerfect etc.

Despite all this it all costs you about the same as a mere upgrade from MagiC 5 to 6.

This is indeed good news for the Milan!!! It means that this bird will be able to surf the web and fly like all the other winged birds out there. With doubled partitions this means that you'd be able to run two or more OS:s, just like any ordinary PC can. On the first partition: SuSE Linux, on the second: MagiC or TOS 7 or whatever. So the browser Messias we're all waiting for will be able to relax and crawl real slow to it's far away destination Javaland. Because we'd already be arrived there on the other partition...

I've heard a rumor that the folks behind the Milan have aquired the rights to the Centurbo board, and also to the double CPU Phenix motherboard. Can we hope for a continuation of these projects in rebadged form? A Centurbo for the TT? A Centurbo with integrated SVGA card? Any comments?

Double MC68060:s (or double whatever CPU) requires much more of the OS than TOS or MagiC can provide for, but Linux is ready for up to 8 CPU:s (if I recall things right). At least on the Intel, Sparc and Alpha platforms.

But folks were buying the highend stuff because the lowend stuff was
tooo lowend and there was nothing in the middle until now.. Avid
milked it all it's worth and did a dumbass thing by stick the middle
pinky at their mac customers after intel invested in the company. This
was going on when Jobs had begun the turnaround and decided not rest
it's fate in a key market in the hands of a skitzo vendor..The rest is
history..

Why wait? You can get a box to run Linux today? So you need Linux to run decent apps?

>   The 'Clap is a disease - and the truth is the cure.....

Just stated a reason not to wait for vapor.

I already have you some names, twinkie. I have a friend who has been making movies on a
Targa 2000-based system for many years.. VERY mid priced. Are you familiar with the
Radius Edit DV?

> > "Uh, Mr. Lucas? I'm sorry, we've switched to Apple Final Cut Pro.. your

Very good, twinkie..

> Pro DV Cameras begin at $2500 for a nice Sony one...Prices are
> falling...

OH MY GOD! There is NOBODY in the industry who would say an XL1 or DVX-1000 is "PRO."
NOBODY!! You keep doing it again and again.. they are fine cameras, to be sure, for the

price.. but NOT pro.

I know it's very painful for you to admit it, but you just don't understand the
business.

> > > What G4 problems?

Give me his email addres and let me ask him.

Better yet, go here:
http://www.digidesign.com/ubb/Forum16/HTML/003225.html

..for a discussion on the problem, including a potential solution (a $700 dual
monitor
card).

Or here:

http://www.digidesign.com/ubb/Forum16/HTML/004153.html

..for a discussion on the problems with three monitors on an AGP G4, including an
admission
from Digi that "it doesn't look good."

All it takes is a little bit of research, twinkie, to prevent making yourself look
more and
more clueless.

> v 2 most likely will be ten times more..The beginning of the end of

> > Oh, twinkie.. I thought it was ALREADY the beginning of the end for Avid?
> > Man, you are
> > FUNNY!!
>
> Just wait and see!

Yep, I will.. it was, what, a year or so that FCP first shipped? Since then, how
many
motion pictures were shot on DV and edited on a FCP system? Er.. that would be
none,

right?

>

"Sure?!?" Does that mean you actually will do some research into the industry?

Come on twinkie.. at least respond to the point above. Do you even know what
Radius'
product is? Do you know what the Casablanca system is? Do you know what a Targa
2000 is?

> > I'm sure you are.. you're trained in FCP, but NOT in the workings in the

> You should try your own thoughts...

Again, twinkie, I KNOW what I don't know.. I DON'T make prognostications about
Apple
because I don't really know the computer market very well, relatively speaking. I
don't
make any predictions about Adobe Photoshop or Quark or Microsoft Front Page or
Apple's
stock prospects or the prospects of OSX or..?!? You get it yet?

Stick with what you know, really.. I'm sure there are some areas where you are
quite
knowledgeable.. this ain't one of them, twinkie!

> > I don't buy from someone who is afraid to say "I don't know, I will check"

Yes, it does take practice. I'm sure you can climb above it if you try...

> > Anyway, twinkie, you forget that I'm in a no lose proposition here.. I win as

Right.. so, again, I have nothing to be "scared" about.. I'm in a no lose
situation. I
don't care what tool I use..it's just a tool.. as long as it's stable, I'll use
it..

> > All the G4/FCP systems in the world aren't going to help you make good video
> > until you
> > know the above.
>
> True...But there are alot of young creative types out there..

Yes there are.. and there will be some great work coming out on these cheaper
systems.
I've been excited about the digital revolution in audio and video for a long
time.. even
though there's more crap then ever before, the cheap technology also gives more
people the
opportunity to do something great.

BUT..

Do you really think these young people with great ideas will stick with FCP when they get more money? DO you really?

To say FCP is bringing about the demise of Avid is ill-informed, foolish, Steve Jobs hyperbole that has no basis in reality.

You COULD make the argument that the digital revolution is causing Avid to rework their strategy.. of course, it's causing ALL players in the market to do that, but at least that would have some truth to it.

So really.. to put it honestly, your ridiculous parroting of the Apple PR "reality distortion" line just serves to make you sound like a stooge. I really believe you're smarter than that.. against all proof, maybe, but I believe it. Act like it..

> Very True..That was covered in the video media production class. But there are lots of creative types out there that can figure out unlike a certain 'chunk's'...
>
> > Who will win? I don't know..
> >
> > All your silly predictions are meaningless.. of course, so are mine, except that I, at least, realize it.
>
> The tone in your post does not indicate this..

Right.. but if you're going to invest in a company, would you listen to your grammy who spends 15 minutes a day on etrade and does no research over someone who spends full-time looking, researching, checking out the market? Wouldn't it seem rather ridiculous to hear your grammy comment about something she knows nothing about?

Your comments are so far off and display such an incredible lack of understanding of the market, yet spoken with such certainty, that they need to be debunked clearly and often.
This is not about any 'tone' of my voice.. YOU set the tone with your ridiculous post. Do I need to repost it? Oh what the hell, let's just look at the headline of this thread:

"The new products with the PM G4 and final Cut Pro could be the final nail in

Avid's
coffin.."

Is that clear enough for you? WHO among us has actually admitted their
limitations in this
thread? Me. Who is clear about the reach of their knowledge? Me. You've
displayed zero
understanding of the limits of your knowledge. Zero.

> > Don't look now.. but once again, you tried to bring the ball inside on me.
> > This time,
> > you didn't even get a chance to try a shot before I picked you clean, then
slammed it
> > over your head.. are you foolish enough to try again?
>
> Than why are you sweating?

Because I'm laughing so hard, I can't believe you would try yet AGAIN to score on
me. As a
matter of fact, I'm laughing so hard I've gone into convulsions, and I'm sweating
profusely.. yet even through the convulsions, I'm STILL able to stick my arm up
and grab
the rebound on your badly missed shot.

That's the difference between Amiga and Atari:

Amiga's developer machine has been announced for ages,
while the MilanII is _already_shipping_ to developpers.

Martin-�ric Racine wrote in message ...
The "oh-so happening" Amiga platform just died, along with its
last issue of Amiga Format. Most of the editorials and readers
comments go along the line of:

"Amiga changed hands so often that we might as well enjoy what's
already there and not hold our breath for anything new".

R.I.P.

Can't say that I've seen an Atari mag on the shelves for several years, but then the Atari platform died some time ago didn't it.

There are still other Amiga mags, including one new one.

And I guess you haven't heard of the new developer machine announced just recently.

No, you just post irrelevant crap in this Atari newsgroup and then turn around and slam others for doing the same.

Regards,

Clockmeister.

What's the point of buying a Milan II for running Linux when you can do that cheaper and more effectively on x86?.

Regards,

Clockmeister.

That's the difference between Amiga and Atari:

Amiga's developer machine has been announced for ages,
while the MilanII is _already_shipping_ to developpers.

But Amiga is looking to the future whilst the Milan II is still stuck in the past. I mean 68k, really...

Regards,

Clockmeister.

It seems there is barely anybody advocating the Atari in this group, whilst
the Amiga groups have plenty of traffic.

Can't advocate something that is stone cold dead I suppose.

In this group, no. In other groups, yes. After 1-2 days I go through
about 50-100 messages. We are out there, just not here....

Hi Darklord, good to see you're still around to provide some clever thoughts ;-)

AC jumped on the Linux bandwagon, and tried to lure the Amigans to the dark
side where men bald quickly.

BeOS would be a natural progression from AmigaOS, being both user friendly
and configurable. Linux is like taking two steps back to take one step
forward... plenty configurable, but user friendliness goes out the window.

Regards,

Clockmeister.

     Unix has always had the potential of being quite userfriendly.
     What hostility it has mostly comes from running on PC hardware
     of which Linux supports more than BeOS.

     It's trivial to be 'easy' when you don't support ISA or VL.

     Outside of professional music/audio you actually see BeOS users
     whining for apps, quite often Linux apps.

     QNX is a better end-user-media-OS right now. QNX actually bothered
     to licence the technology for DVD movie decode. They have flash and
     realaudio NOW (as does Linux) and the upcoming freebie consumer
     desktop distro has most of the common GNU tools and a version of
     Quake III (which hasn't come out for BeOS yet, but has come out
     for MacOS and Linux).

     ...and the ease of BeOS is overhyped. It has it's own usability
     problems.

     The way things are going, QNX will get a version of Quicktime 4
     before BeOS does.

I've read in several places that BeOS takes the better ideas from
AmigaOS and TOS and takes them one step further.  I agree.

Be is a 'media OS'.

However, Be is lacking (relative to a volunteer projects: Linux, FreeBSD) in the area of media device support and media format support.

BeOS has some major holes. So does Linux and FreeBSD. Although ironically Linux and FreeBSD have less.

BeOS excels more in terms of the more vertical rather than as a general purpose desktop machine.

>
>> It's trivial to be 'easy' when you don't support ISA or VL.
>
>ISA and VL are dead.

They aren't quite dead yet. Even in the retail channel for NEW products, ISA slots are still being perpetuated. This isn't even getting into legacy hardware. Furthermore, the lesser hardware support makes replacing such legacy bits of hardware more expensive.

>
>> Outside of professional music/audio you actually see BeOS users
>> whining for apps, quite often Linux apps.
>
>Naturally. Who would want to see Windows apps ported, it's not in the spitit
>of using an alternative OS.

...they clamour for some of those as well.

Windows APPS aren't usually the problem: the OS usually is.

Most application developers just can't drag themselves away from the Win32 gravy train. (Hurts all the other platforms) What interesting commercial apps that Be does have have come with considerable marketing effort on the part of Be.

Modem's don't like lots of OSes. Due to the 'no-isa' policy,

quite a few are quite unavailable to Be. Others require
device drivers.

I'm not sure what other problems you could find to have with
the few that remain after you eliminate ISA and winmodems.

Proxy settings are application specific and don't tend to
vary from platform to platform but rather app to app.

>
>> The way things are going, QNX will get a version of Quicktime 4

>>
>
>Be needs to do more to help that situation.

As a commercial competitor with limited marketshare, limited mindshare
and no active userbase to 'pitch in', BeOS is in a disadvantaged
position.

BeOS is lacking in hardware and software support, that is true, however,
what is available is generally pretty good (except for the news clients :-(

> It's trivial to be 'easy' when you don't support ISA or VL.

ISA and VL are dead.

> Outside of professional music/audio you actually see BeOS users
> whining for apps, quite often Linux apps.

Naturally. Who would want to see Windows apps ported, it's not in the spitit
of using an alternative OS.

>

And I'll be one of the first to download QNX. The single floppy demo was fairly impressive - for what it was, but way too limited in functionality. That should change with the freebie :-)

Win98 is on gaming duty ;-)

> ...and the ease of BeOS is overhyped. It has it's own usability

No problems here. I was online 5 minutes after installing BeOS, no problems.

Linux didn't like my modem or my proxy settings, and refused to work properly. (Same machine as the BeOS install)

> The way things are going, QNX will get a version of Quicktime 4
> before BeOS does.
>

Be needs to do more to help that situation.

Regards,

Clockmeister.

For fun, of course. You don't run a UNIX permanently on an amiga, that's
a machine with soul, and the soul is the AmigaOS.
Nevertheless, why buy a Milan for running Linux? If you're going to run
Linux, there are far better platforms. Just about every platform, as a
matter of fact. You're bound to get a more capable Sun or DEC at a lower
price.

:> What hostility it has mostly comes from running on PC hardware
:> of which Linux supports more than BeOS.

: BeOS is lacking in hardware and software support, that is true, however,
: what is available is generally pretty good (except for the news clients :-(

Speaking of news clients, I registered Thor yesterday, using secure
ordering through Voyager 3.2.

:> It's trivial to be 'easy' when you don't support ISA or VL.

: ISA and VL are dead.

While ISA should be dead, I've got a heap of them here, and they're doing

quite fine, too. I've even got a friend who's using an ISA ehernet card in his Amiga 4000, and we're trying to get some 8-bit ISA NICs running on our Amiga 2000 stack at the computer club.
Not to mention the loads and loads of PCs running ISA cards. ISA NICs are far from dead.

:> Outside of professional music/audio you actually see BeOS users
:> whining for apps, quite often Linux apps.

: Naturally. Who would want to see Windows apps ported, it's not in the spitit
: of using an alternative OS.

Besides, common GNU tools give that extra comfort and look-a-likeness to your OS.

:> QNX is a better end-user-media-OS right now. QNX actually bothered
:> to licence the technology for DVD movie decode. They have flash and
:> realaudio NOW (as does Linux) and the upcoming freebie consumer
:> desktop distro has most of the common GNU tools and a version of
:> Quake III (which hasn't come out for BeOS yet, but has come out
:> for MacOS and Linux).

: And I'll be one of the first to download QNX. The single floppy demo was
: fairly impressive - for what it was, but way too limited in functionality.
: That should change with the freebie :-)

Pfah, it was a single floppy, all right, but a compressed RAM drive in reality. It wouldn't run on the 4 MB machine.

: Win98 is on gaming duty ;-)

Oh no it isn't. The only MS products around here are a copy of Arabian Windows, Microsoft Basic on the C64s and Dragon32, and possibly PC-DOS on the PS/2.

:> ...and the ease of BeOS is overhyped. It has it's own usability
:> problems.

: No problems here. I was online 5 minutes after installing BeOS, no problems.

I must get a Pentium or PMac. Or is there a free version for PMac?

: Linux didn't like my modem or my proxy settings, and refused to work
: properly. (Same machine as the BeOS install)

Linux installed quite painlessly on the same machine as OS/2, but then, it's just on the local network and no modem connection. X just resulted in garbage (Onboard Compaq circuitry), but it swallowed most every NIC I threw at it.

:> The way things are going, QNX will get a version of Quicktime 4
:> before BeOS does.

: Be needs to do more to help that situation.

Bah, who needs QT4?

Just 1 is still enough to keep the hell alive. If it's your last slot,
then you pretty much have to use it. Lord knows I'd rather use PCI
ANYthing in place of that one last, lingering PCI slot.

Besides, there are still machines that are plenty capable that aren't
necessarily 'brand new' out there.

[deletia]

Even 4M wasn't really sufficient for Win 3.1.

     Funny, it could handle mine. Didn't have any problems with the
     internal hardware modems either. You should be able to push
     characters out the com port with AT commands as if it were an ST.

     A 'mediaOS' should certainly be able to handle the predominant
     media types found on the web. This includes QT4. A 'mediaOS'
     should also support software DVD decode.

     Considering that 'mpegs running on the sides of a cube' demo,
     these sorts of feature should be a no-brainer.

: In presume those Amigas have a bridgeboard or goldengate device to allow
: access to the motherboard ISA slots then, considering that the ISA slots
: are only powered by the PSU but otherwise aren't electronically connected to
: the Amiga in any way.

That's true. My friend runs a Golden Gate II+ in his A4000, and we're
fiddling with A2088 PC emulators at the club. A really odd solution. In
order to run a NIC, you need to run MS-DOS on the emulator, then run a
packet driver, then server software which ties into the Hydra device for
sharing resources between the Amiga host and the PC card, and then run a
network driver on the Amiga side, talking to the PC through Hydra.device.

:>Not to mention the loads and loads of PCs running ISA cards. ISA NICs are
:>far from dead.

: Old, outdated PC's. Most new motherboards have either no, or only 1 ISA
: slot. ISA may not be dead in a legacy sense, but as far as today's

I wouldn't know, I'm one of those really odd people who actually doesn't
throw out a computer which is only five years old. However, my friends
with cable TV internet received nothing but ISA NE2000 cards.

Yep, but they run. A friend of mine runs his entire network through an MCA
Pentium PS/2 with Linux. MCA isn't that bad in theory, actually quite able
to compete with PCI according to what I've heard, but its "autoconfig" or
"plug'n'play" is appalling, requiring a disk-based configuration. How come
they throw BASIC into the ROM, but not the most basic config utilities?

:>: Linux didn't like my modem or my proxy settings, and refused to work

That's peculiar. PCI 100BaseT NICs are down to $20 these days.
The real problem is having a free PCI slot. I had to resort to
ISA for a machine that had run out of PCI slots.

[deletia]

You don't need to be running a 5 year old machine to be in
the position where an ISA card is your only option.

That's a lot of messing about, but in true Amiga fashion it will probably
work just fine ;-)

I still use my Amiga occasionally, not to mention the 486 and 386's I have
laying around.

Linux requires fiddling to run at all on certain PS/2 models.

MCA isn't that bad in theory, actually quite able
>to compete with PCI according to what I've heard, but its "autoconfig" or
>"plug'n'play" is appalling, requiring a disk-based configuration.

Right, and the configuration procedure can be quite painfull. (speaking from experience ;-(

 How come
>they throw BASIC into the ROM, but not the most basic config utilities?

Because IBM used to charge a pretty penny for the configuration disks, or
reference disks as they called them. The BASIC was just a remnant from the
original IBM PC, including the casette support.

>:>: Linux didn't like my modem or my proxy settings, and refused to work

Both the modem (Netcomm) and the rest of the computer work perfectly well
with Be and Win9x.

Jeeez.....Why is it so difficult to bring out this blasted box? All
the Jihads were jumping up and down that this baby would be available
by March/April. It's only a 68k box for christ sakes! Plus Motorola
is building it. Sounds like Jack/Sam T are in charge again. The other
guys have moved on...

New price for all Softjee software. All Softjee software are also included in a pack but you can buy each software separatly.

* Audiomid   90 FF (9 pounds, 15 USD)
* Devil Studio 190 FF (19 pounds, 30 USD)
* D.H.S.   290 FF (29 pounds,45 USD)
* D.T.   90 FF (9 pounrds,15 USD)
* Easy beat   90 FF (9 pounds,15 USD)
* Expand 2   190 FF (19 pounds, 30 USD)
* Midplay   90 FF (9 pounds,15 USD)
* Pretty   90 FF (9 pounds, 15 USD)

*** Softjee Pack (Audiomid, DHS,DT, Easy beat, Expand 2, Midplay, Pretty) : 990 FF (99 pounds)

Shipping : 20 FF (2 pounds, 4USD) exept for the Softjee pack (50 FF 5 pounds, 9USD)

Products informations : http://www.softjee.com
Informations at : softjee@softjee.com

When I'm not messing with BeOS or Linux. I still use my A2000 for Octamed mainly, creating some noise to play guitar to.

AmigaOS booted of a single DD floppy doesn't include a web browser either.
Regardsless of the technology used, QNX still boots off a single floppy and
the RAM requirement is negligable by todays standards.

:   If it fits on the single boot disk, then it fits on the single
:   boot disk end of story. It doesn't matter what 'better tech' is
:   being used to get more out of the boot medium.

If it fit onto a single disk then it wouldn't eat up four megabytes of RAM
decompressing. It isn't any standard 1,44 floppy.

:   The end result remains the same.

Oh, you're so pragmatic.

: [deletia]

:   No version of Windows worth running is going to fit on a floppy.

I suppose you're correct there. Still, it's no that impressive a feat,
considering that it isn't Windows.

So? I could manage to get ~ 1M uncompressed out of DD ST

```
     formated FAT16 disks using a particular Frech Formatter
     and impecable media as well as impecable hardware.

     Use an extended FAT format with a HD disk and fairly mundane
     levels of file compression and 4M on a floppy disk isn't that
     much of a stretch.

     That's not the point. QNX is infact a superset of Windows in
     any of it's forms. It just so happens that QNX is both more
     modular and more efficient than WinDOS.

     I have purchased a new computer, until the Milan arrives.

In the meantime all of my Ataris are forsale in one bundle, and all the
```

software will go with it.

1) TTO30 6Meg Ram 250Meg Drive SVGA monitor 14inch

1) Falcon 030 14 Meg of Ram 270meg Syquest, 80 meg internal
   15 inch SVGA

2) MegaSTes 4 Megs of ram 50 and 250 Meg hds

5) 520STs, 3 1meg, 1 2.5 meg, 1 512k ram.

2) MegaSTs, 2 meg of ram

1) Megafile 30
1) Megafile 60
1) SH204

4) SM 125

3) SM 124

8) SC1224

1) Nec 2* CD rom

1) 1040ST

1) 1040STe (2meg)

500 boxed commercial software including

Magic, Geneva, NeoDesk, Calamus SL 95, Pagestream 2.2

Many boxed Games (100s).

do not email for a complete listing, ask me if I have it, I probably do.

$1000 CDN for Everything.

Please ask publicly for any details, so I don't have to repeat myself.

Thanks guys, its been a blast.

I am moving on.

Later Brian.

Mostly developpers in France and Germany, at the moment. There
are also a few customers who prepaid theirs months in advance and
got it at the same time.

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?
A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

It's April, the G4/500 is available down the street, the Milan II may have gotten lost in the Atlantic. While the roll out of the Milan II is being dragged out, the other computer firms have moved on to the next big thing...

The Milan II Jihads were swearing up and down that the box would be available by March..Will folks it's April.....

Has Motorola fell down on the job, or is that producing 50 units per month is not worth while?

sinclap!

somewere in mn..

Whos Chunks? Do you mean you? How could I join your rank and file?

Simple! I want to learn to use Midi, and the best product available, according to you was the iMAC. Now if you could direct me to that valuable Adobe Midi Software you mentioned earlier....

I am sorry Ken. You were too late. All deals expired April 1st 2000. Luckily most inquiries came after April 1st, like it was April 2nd in Europe and still April 1st here, and all the other inquiries, I simply had to tell them I am lying!!! Its not forsale, it was typical April Fools Quackery.

However, there is actually more than I have listed, and if I were to sell it, I would sell it all for the price above and still be content. But I would have to be finished with Ataris, which I am far from doing just yet.

I am also waiting for the Milan II. I hope for a fall date, as this is when I start doing most of my Computing. But I have a difficult time letting my Ataris Go. My Friends would kill me, and I do donate a handful of Atari Set Ups each year to those who need them.

Later Brian.

Chunk's is the one and only VP of TAF...Who has been absent lately..I
wonder if it has to do with a lady friend.

:I am sorry Ken. You were too late. All deals expired April 1st 2000.
:Luckily most inquiries came after April 1st, like it was April 2nd in
:Europe and still April 1st here, and all the other inquiries, I simply
:had to tell them I am lying!!! Its not forsale, it was typical April
:Fools Quackery.

:However, there is actually more than I have listed, and if I were to
sell :it, I would sell it all for the price above and still be content.
But I :would have to be finished with Ataris, which I am far from doing
just :yet.
:I am also waiting for the Milan II. I hope for a fall date, as this is
:when I start doing most of my Computing. But I have a difficult time
:letting my Ataris Go. My Friends would kill me, and I do donate a
handful :of Atari Set Ups each year to those who need them.
:Later Brian.

hey great!!
i am glad you are not selling. I didnot see your mail until sunday,
so i didnot notice the april fool (that i am)!!
like you, i am waiting for the milan2.
i want the ATX case, so I can expand it.
good news it will be falcon compatible AND have MIDI as standard.
I should have the 1000$ or so by september also.
whoever gets one first has to demo it at a TAF meeting!!
ken

I guess the Mac G4 + FFCP are capable of the news broadcast at best. When
will see "NYPD Blue" be taped in DV25?

-

CASE STUDY

The Making of The Shadow of Doubt

How indie filmmakers Cynthia and Geoff Wells produced a 2D animated movie using digital desktop tools.

by Jennifer A. Champagne

Almost everyone on Earth has an inner voice urging them to express themselves. On an artistic level, there are a number of ways to do that. Pencils, paints, conte crayon, and other mediums provide an eye-to-hand extension. Others want to express themselves in story-visually, at that. Enter the realm of filmmaking.

Filmmaking is among the most costly ways to express your creativity. And within filmmaking lies the genre of animation, another costly venture. However, in true independent spirit, the creative team of Cynthia and Geoff Wells, who head up The Digital Theater Group, have shown that high-end animation can be done with relatively low budgets from within the home. They set up a self-sufficient animation studio near Hollywood that consists of a couple of Intel-based machines, some peripheral hardware, and-oh yes-an animation table.

When they decided to make The Shadow of Doubt, the follow-up to the award-winning Interview with Tallulah, Queen of the Universe, Cynthia and Geoff already knew the costs of animation production and the amount of time it would take. They also were aware of the breakthroughs in digital technologies that would speed up this process; but until then, the cost far outweighed the practicality. A lot of hardware and software had emerged that would allow The Digital Theater Group to go into production without incurring exorbitant equipment or services costs. It was very important for them to have the creative control of the project without the influence of outside investors. Therefore, the budget had to fit within the constraints of a small studio and small budget. Every piece of software and equipment had to pass the "must-have" test.

In The Shadow of Doubt, a blues singer (Tallulah, pictured above) returns to the Paris club where she got her start. While preparing to go onstage, she is confronted by a ghost in her dressing room mirror. The ghost offers great success and fame in exchange for ignoring the club owner who gave Tallulah her big break. She resists the temptation and goes onstage to sing.

Cynthia and Geoff went through the arduous process of researching the products they would need to take the project from beginning to end while relying on as few outside services as possible. They already had the animation pipeline in place. Cynthia, a veteran animation director, created the bulk of the animation. Volunteer animators, inbetweeners, and cleanup artists stepped in to assist Cynthia with the backbreaking work. In exchange, they received one-on-one training from Cynthia. The process of "shooting on twos"-creating 12 animation cels and repeating each to produce one second of 24fps 35mm film-is standard for any animation studio producing high-end animation (as opposed to Saturday-morning fare, which is often shot in fours or even eights). At the time of this writing, there's no computer or piece of equipment that will provide the 2D drawing. So where does the high-tech equipment come into play?

The digital ink-and-paint software was the first thing to choose. This, after all, determined the type of computers, the OS, the peripherals, the amount of RAM required, and so on. With a number of programs available-The Animation Stand, Animo, Toon Boom, RetasPro-the couple ultimately decided on Softimage Toonz (DV#203). Toonz wasn't the least-expensive piece of software, but it provided the necessary tools for Shadow and it incorporated the proper analogies from the animation industry. Toonz utilizes exposure sheets, camera stand information and direction, and terminology that traditional animators use everyday.

To The Digital Theater Group, this transition from hand-drawn to high-tech also had to preserve Cynthia's drawn-line quality. Because Toonz utilizes raster-based scans and doesn't try to smooth out the lines by vectorizing them, the line quality was maintained to director Cynthia's satisfaction. The lines are also kept separate from the paint; so when the army of volunteer ink-and-paint artists stepped up to work on the project, there was no danger of sacrificing line integrity. The DIP (digital ink-and-paint) artists merely had to go in, fill the areas with paint, and tint the lines.

This screenshot from Softimage Toonz shows the Camera Stand, the most powerful module in the Toonz program because it enables you to compose a 2D animation scene in virtual 3D. While other programs let you preview from within the camera view, in Toonz you have to preview your work in Camera Stand in another screen.

This separation between ink and paint is a large part of the flexibility of Toonz. Once the colors are laid into place, the art director can go back to the painted animation and modify the colors. For instance, if a character has a standard palette but the lighting in a scene needs to be altered, you would think that the character would have to be repainted. But in Toonz, the colors of the paint can be adjusted, and the change is reflected in the entire scene. Everything painted with the new color will be adjusted on every frame. This added a lot of flexibility and malleability to the project, as elements could be easily altered late into production.

Toonz is not an inexpensive program (about $12,000 for the license, plus $2000/year for support and upgrades), but it passed the must-have test. The investment proved worthwhile because it let them do the finished project properly.

Milling through the different operating systems for computers is always a (cue the sarcasm) joy because each company has its own agenda: to get you to buy its system. So, the choice becomes a matter of cost versus functionality. The Digital Theater Group had already placed their bets on Toonz, so that immediately eliminated the Mac OS. The race would have dropped out Windows NT and left SGI IRIX as the winner, but Digital Video, an Italian software subsidiary of Miscrosoft, had recently ported Softimage Toonz from IRIX to NT. This let The Digital Theater Group stray from the historically expensive SGIs and invest in a more cost-effective NT machine.
A Gateway GP6 450MHz PC (DV#204) was purchased with a standard 12GB hard drive and 256MB RAM. A 20-inch Viewsonic 20G monitor (DV#205) was used as the display. Not only was this a good move for running Toonz, it proved to be a cost-saver with regard to the production software-Adobe Photoshop, Premiere, and so on-because the IRIX versions of those packages, if available at all, are more expensive than the NT versions. For the peripherals and extras, Geoff attributes substantial cost-savings to online shopping. Anything from Jaz drives to DLTs to tape stock was obtained through online shopping at rates that are less than those offered by retail vendors. Among the necessary equipment for backup and storage, they used a Quantum DLT 4000 drive (DV#206) and an 18GB Quantum Atlas III SCSI drive (DV#207) for temporary storage.

An additional and necessary piece of equipment was the scanner they used to bring the animation drawings into the computer. Although tradi-tional flatbed scanners could be used for the process, the producers decided to invest in a Ricoh scanner specifically designed for animation. The decision was twofold: first, the scan-ner would automatically feed the animation paper and scan it, eliminating the task of manually switching out each frame; and second, the scanner can be controlled through Toonz, which could adjust the exposure levels accordingly and register each drawing according to the peg holes at the bottom of each page. Again, The Digital Theater Group was adamant about doing the job right and they spent the extra money on the right scanner for the job. The money they spent on the right equipment saved potentially hundreds of artist-hours in scanning alone.

In this sequence, Tallulah is drawn into her dressing room mirror by a ghost as she prepares to go onstage.

Outside of the cost of equipment and supplies, an animation house has a staff of artists and support people, whose salaries contribute to the pri-mary cost of production. Now that the hard costs have been brought down to reasonable numbers, the problem becomes choosing the people who are going to help you. The Digital Theater Group was able to recruit over a hundred talented people to assist with the project. Among those people were an art director, composer, sound fx and Foley artists, voice talent, animators, inbetweeners, DIPers, layout artists, visual effects artists, painters, and a 3D artist. The producers knew that they had the right equipment, but they weren't going to fool themselves into thinking that they could do it alone. They were certainly capable, but they needed the production to be done the right way-and the right way was finding the right people. This is the key for both large and small animation houses. So, how do you find those people, and how do you get them to help you?

The first and foremost method of recruitment is having a project that people will love and will want to work on. The project has to mean something to them, and they have to be able to take pride in working on it. Cynthia already had a reputation for amazing work, and she had developed a network of talent from working in the animation industry. But more important, the story that they wanted to tell was moving, and the beauty with which it was told convinced people to invest their time and talent.

This multiple-layer scene was created by applying transparency and blur effects in Toonz.

The Shadow of Doubt was cut on Adobe Premiere (DV#208) with a Pinnacle DC1000 capture card (DV#209), utilizing a 70GB Medea RAID for AV playback.

For the project, Premiere had all the necessary features that a nonlinear editor should have, and it had mature three-point editing, which is a standard for Avid, Media 100, Discreet edit, and other high-end NLEs. Premiere was used to tweak timing and pace-making sure that everything worked before committing to film. The Digital Theater Group cut at 24fps to conform to film, but they used 3:2 pulldown to bring it to 29.97fps for video purposes. Ultimately, the team needed both frame rate versions, with video used to present the piece before the final output to film took place.

After the film's release, Shadow will be run back through telecine and put onto video.

The Shadow of Doubt was going to film as I wrote this. The fact that it was going to film determined a number of factors in production. The first was the resolution of the frames. Normally the resolution of a film frame is 2K, or approximately 2000 horizontal lines, which is approximately 9MB per frame. At five minutes, Shadow took up approximately 64GB. This is final output only, which doesn't include all the layers of characters (painted and unpainted), the backgrounds, and the FX layers. The producers felt that the amount of data was going to be too much of a burden on the system and opted to go for 1K, or roughly half the size. The images would be scaled up on the film recorder. The scaling slightly softened the image, but The Digital Theater Group-in the spirit of doing things the right way-shot out a short test to make sure that the scaling process didn't have a deleterious effect on the images. It didn't. In fact, they preferred the slightly softer look because it suited the dark jazz theme of the story. They proceeded with production at 1K.

The waiter is yet another character designed by Cynthia Wells (in fact, she designed all the animated characters in The Shadow of Doubt). This transitional scene in the storyline displays the very important painted background. The producers felt that this background was crucial to the overall look and artistic feel of the project. Donna Prince, the art director, was going for a painted look. The backgrounds were hand drawn and painted, scanned at 400dpi, heavily manipulated in Adobe Photoshop, and then imported as a Targa file into the Softimage Toonz.

When discussing film-out, the actual cost of the process surprises most people that I speak with. The going rate in the Los Angeles area for recording digital images onto 35mm film runs about $2.75/frame. At initial glance, you may think that this doesn't sound so bad. Then you realize that the project has 7200 frames in it, and the cost is put into perspective. However, as with all things in this industry, things can be negotiated. And, using the same method as the recruitment of talented artists, The Digital Theater Group was able to convince a recording house that their project was worth investing in, and the price was haggled down to a range that would be more fitting for a small animation studio. I don't presume to say that everyone will give you everything you need, but you'll be surprised at what you receive when you ask for it and have the right project behind you.

Shadow will be making its way into the festival circuit upon completion. Other distribution channels that the producers investigated were the Internet, film, and television markets. This project has shown that high-end animation can be produced by a small studio, with a small budget, on computer systems that can compete against the more expensive gear used by larger studios. It also shows how talented people will band together to create something from nothing, based on the knowledge that their participation will help make something worth watching. The joy is in the accomplishment, and the accomplishment is made possible by tools that are affordable. Cynthia and Geoff Wells have shown us that creation is really only limited by your creativity.

Jennifer A. Champagne is cofounder and vfx producer at Max Ink Cafe, an animation and FX boutique in Venice, CA.

Well I have officially retired my copy of Netscape 4.72 as of tonight.
I just finished installing iCab 2.0 and updating the bookmarks files.
This is a very cool browser now.
It supports all the plug-ins including Quicktime (yahoo).
The fully drag-and-droppable text has always been a winner, but with all
the new features and what
amazing speeeeeeeed, I am won over.

I tried Netscape 6 beta, yack droppings, yeuuuucchhhh.
Could anything be more obnoxious.
Gosh maybe they want you to BUY SOMETHING.

iCab now offers full imports of all bookmark files from Netscape or IE.

Speed, ram frugalness, and I really love the fact that you can set
animated GIFs to only run once.
Full cookie control, resumable downloads, and you gotta love that
downloads window.

No extra crap.
Just one kick ass browser, and not one......I repeat, not ONE.......
extension or library added to
my system folder.

Why can't the other guys do it this right.

Oh yeah, one more thing I love, unlike IE and Netscape, iCab renders the
banner ads LAST, not first
with a delay (for your reading enjoyment).

Just thought I would share my joy.

www.icab.de/

Go get it.

Netscape 6 sucks! I will switch over to IE 5 when I need to.
Actually, will make the switch when my field 1998 PB G3 is swapped out
for the PB G3 Pismo.

Power Mac Bests the Gigahertz PCs

Henry Norr   Monday, April 17, 2000

During the past 18 months, while top PC processor speeds have jumped from 450 megahertz to a gigahertz, the PowerPC chip used in Apple Macintoshes has climbed only from 400 to 500 megahertz.

But the PowerPC has always been able to get more work done in each clock cycle than Intel and Advanced Micro Devices processors.

That's all the more true with the latest PowerPC, the G4, especially with programs updated to take advantage of its key innovation, a ``vector-processing unit'' Apple calls the Velocity Engine.

Still, running at half the clock speed of the competition is a significant handicap, and as I tested the performance of the new gigahertz PCs, I wasn't at all certain Apple's machines could keep up. So I set out to find out.

Unfortunately, none of the major benchmarks of real-world performance runs on both platforms, so I turned to Adobe Photoshop 5.5, a program available in virtually identical versions for Mac and Windows. It's not only a widely used application, but also a pretty good indicator of overall processor performance.

Using the same test file -- a 50- megabyte scanned image of Yosemite -- and an Adobe plug-in that tells Photoshop how to take advantage of the PowerPC G4's Velocity Engine, I clocked a series of seven processor-intensive operations -- the same ones I had earlier run on the PCs -- on a 450-megahertz Power Mac G4. (Apple announced a 500-megahertz version of the same machine in February, but I didn't have access to one of those.)

When I first ran the tests on the Power Mac, it ``only'' had the 128 megabytes of memory that comes standard with this model. In this configuration, it handily outperformed one of the gigahertz PCs, a Hewlett-Packard 1G with Intel Pentium III and 128 megabytes of RAM. The Mac beat the Pavilion on six of the seven tests; its total time for the whole sequence was 118 seconds, nearly a third faster than the 185 seconds the Pavilion required.

But the other gigahertz PC, Polywell Systems' Poly 800K7-1000 with an Athlon processor from Advanced Micro Devices, had done even better, finishing the sequence in just 82 seconds. The Poly, however, had a big advantage: 256 megabytes of memory. To level the playing field, I swiped a 128-megabyte memory module from the Gateway Select 1000, which was already idle because its screen had gone blank. I restarted the Mac, adjusted Photoshop's memory settings to use the additional RAM and tried the tests again.

This time, there was no ambiguity: the 450-megahertz Power Mac blew both gigahertz PCs out of the water, completing the seven-operation sequence in just 55 seconds. Whereas the Athlon-based Poly had scored about a third better than the Mac when the former had twice the memory, the Mac cut its time in half and finished a third ahead once the two systems were configured equally.

Applications differ, of course, and no doubt there are legitimate comparisons where the PCs would come out ahead. But in spite of Adobe's roots on the Mac, it can hardly be accused of optimizing its products only for Apple hardware -- at times in the past Photoshop has run better on the PC.

In short, Mac partisans have no reason to panic about the PowerPC's current clock-speed shortfall, and graphics professionals who rely on Apple have no reason, at least in terms of performance, to doubt their choice of platforms: The Mac's resounding victory in this particular test is strong evidence that the PowerPC remains more than competitive with the best Intel and AMD can produce.

For now, anyway.

I have...Dumbass!!! You see...Lots of firms have bought the avid systems and used like 10% of the functionality and paid for the remaining 90% that they did not use. Avid is in trouble with declining sales, losses and upteenth restructuring in months. Lots of stations are buying FCP solutions...

Twinkie.. it would be a good idea for you to learn the limitations of your knowledge.

Most people aren't about to shell out $30k for a system and use "like 10% of the functionality" twinkie. They buy Targa 1000 or Targa 2000 systems.. or they buy Radius Edit DV systems.. or they buy a Casablanca... or some other $5k system. OR they buy a mac and FCP.. or they buy a grey Imac DV-SE or whatever they're calling it.

I don't know or don't care about Avid's "declining sales," I haven't paid attention.. but Avid's "coffin" isn't any more occupied than Apple's, twinkie. Again, Avid's market has never been about how many systems they can sell to little Sinclap's to edit their video of their grammy and grammpy's.. they sell to people who MAKE MOVIES. Or do INDUSTRIAL VIDEO. Or edit TV COMMERCIALS. Most of the time, they're not shot on any DV format camera. To those people, FCP doesn't do jack. To these people, saving $30k doesn't mean JACK if they can't choose the codec they use, or if there isn't a fully genlocked, fully professional component I/O and fully balanced audio I/O available. To those people, saving $30k means nothing when they are making several hundred bucks and up an hour with a client breating over their shoulder backing up to a deadline 15 minutes away..

Again, exactly how many major movies.. hell, how many movies have you EVEN HEARD OF that were edited in FCP?   That would be.. NONE! How many national and even regional commercials? I haven't heard of one..

FCP is a great program, don't get me wrong. Like I said, I use it and like it. But saying it's bringing about the demise Avid is.. well, just the kind of ill-informed, Press Release parroting, Steve Jobs butt kissing, market ignoring, reality distorting drivel that I expect from you, twinkie.

"Thinking Different" means not just parroting, twinkie. You forgot about the first part.. the "thinking" part.

I feel like Dikembe Mutumbo, watching your little wimpy 12 footer sail through the air.. reachin' up, and swattin' it up into the cheap seats. Get that shit out of here!! Come back when you got GAME.

:)

Hi there,

sinclap wrote:
>
> Where's Milan II?

Not far away now.

Machines are being delivered to developers very soon, and after that they will go on sale en masse by late northern hemisphere summertime, if what Milan are saying is true.

Check it out at:

http://www.milan-computer.de/gb/news/news032000a.html

The strategy is an interesting one, but is certain to win some followers, especially those users who need simplicity and speed in what they do with their computer. Of course the enthusiasts among us will have a field day seeing how quick our software will run under the 060 system. MagiC Milan and Jinnee also will show Windows and Mac users alike just how small yet powerful an OS should be...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sounds like the same old Atari with Sam T calling the shots..Meanwhile
the other guys are working on the fourth revisions..

Gee, twinkie.. having a little trouble finding my post? Or are you having a little trouble responding to my post?

I'll just repost it for you because I'm such a decent guy..

Twinkie.. it would be a good idea for you to learn the limitations of your knowledge.

Most people aren't about to shell out $30k for a system and use "like 10% of the functionality" twinkie. They buy Targa 1000 or Targa 2000 systems.. or they buy Radius Edit DV systems.. or they buy a Casablanca... or some other $5k system. OR they buy a mac and FCP.. or they buy a grey Imac DV-SE or whatever they're calling it.

I don't know or don't care about Avid's "declining sales," I haven't paid attention.. but Avid's "coffin" isn't any more occupied than Apple's, twinkie. Again, Avid's market has never been about how many systems they can sell to little Sinclap's to edit their video of their grammy and grammpy's.. they sell to people who MAKE MOVIES. Or do INDUSTRIAL VIDEO. Or edit TV COMMERCIALS. Most of the time, they're not shot on any DV format camera. To those people, FCP doesn't do jack. To these people, saving $30k doesn't mean JACK if they can't choose the codec they use, or if there isn't a fully genlocked, fully professional component I/O and fully balanced audio I/O available. To those people, saving $30k means nothing when they are making several hundred bucks and up an hour with a client breating over their shoulder backing up to a deadline 15 minutes away..

Again, exactly how many major movies.. hell, how many movies have you EVEN HEARD OF that were edited in FCP? That would be.. NONE! How many national and even regional commercials? I haven't heard of one..

FCP is a great program, don't get me wrong. Like I said, I use it and like it. But saying it's bringing about the demise Avid is.. well, just the kind of ill-informed, Press Release parroting, Steve Jobs butt kissing, market ignoring, reality distorting drivel that I expect from you, twinkie.

"Thinking Different" means not just parroting, twinkie. You forgot about the first part.. the "thinking" part.

I feel like Dikembe Mutumbo, watching your little wimpy 12 footer sail through the air.. reachin' up, and swattin' it up into the cheap seats. Get that shit out of here!! Come back when you got GAME.

:)

-Mark

sinclap wrote:

I have...Dumbass!!! You see...Lots of firms have bought the avid systems and used like 10% of the functionality and paid for the remaining 90% that they did not use. Avid is in trouble with declining sales, losses and upteenth restructuring in months. Lots of stations are buying FCP solutions...

Think DiabloII will be released at the same time as Windows as Mac
gamers have believed for the last 2 years? Like the official FAQ, and
that walking hemmoroid the 'Clap has suggested? Think different.

From Blizzard Press Relase at:
http://www.diabloii.net/pressdesk/blizpr29april2000.shtml

'Diablo II is being developed by the Blizzard North design team and is expected to release during the first half of this year in Windows� 95/98/2000/NT format. A Macintosh version of the game will be available during the third quarter 2000.'

Sorry Mac users. You get to wait again.

And the Stress Test signup begins Monday. Except for Mac users, of course.

Regards,

WinGuy

Oh, believe me.. in the bigger scheme of things, I know next to nothing about video

and filmmaking next to the greats. But.. I know enough to make money at it.. and
you?

Sure, for that level of videomaker.. I've never argued that, twinkie.

> Oh PHuLEAze..Before FCP and the new toys at NAB, there was nothing
> between the lowend and the highend range of products/prices...Now there
> is...Thats why Avid is in decline..Even Robert Morgan states to the
> fact...

Once again, talking out of your asshole. Avid has a low end pro product.. called
Xpress. There have been a bunch of other Targa 1000 and Targa 2000 based systems
that do a lot for less money then the Xpress. You are so clueless, you don't even
understand the advantage of FCP.. that is, for those who shoot DV, it allows for
host based no loss capture and edit.. and the software is the best at its price
point.. but it's designed for those who shoot DV.. not many pros do, twinkie.

Why do you insist upon make yourself look more and more moronic?

> The new Oxygen network uses mostly FCP systems(will be eliminating the
> $100,000 Avid set up) and KCCI TV Des Moines uses FCP to name a few..

MOVIES.. I said MOVIES. I don't deny that FCP is a good choice as an editor in
any
situation where they shoot DV.. unfortunately, movies aren't shot on DV, twinkie.

> > FCP is a great program, don't get me wrong. Like I said, I use it and like
> > it. But saying it's bringing about the demise Avid is.. well, just the kind

>
> Get use to it..Apple is selling lots of G4's with FCP systems..

Get used to your foolish statements? I am, believe me.

Again, I'm sure they're selling many, and I'm pleased, I like Apple (though I
don't
particularly like Apple evangelist parrots like yourself who state the party line
by
rote then say "think different."). Of course, there are problems with those G4s,
aren't there? Are you even aware of the problems Pro Tools users are experiencing

with them? I didn't think so.

Again, I think FCP is a good program, twinkie.. it works pretty well for a rev 1 program.. and is a good choice for many low end editors who shoot on DV. FCP is NOT bringing about the end of AVID any more than Linux is bringing about the end of Apple.. they are different, twinkie..

Of course, anyone with the least bit of understanding of the little details of the market understands that..

> > "Thinking Different" means not just parroting, twinkie. You forgot about the
> > first part.. the "thinking" part.
>
> You are suffering the 'think denial part'...

Right.. once again, you do an excellent job at pointing out the limitations of your knowledge far better than I could. You are clueless enough to not even understand the advantages of the product you are cheerleading. I hope other "apple power reps" are trained a little better..

THINK DIFFERENT than Steve Jobs, twinkie.

> > I feel like Dikembe Mutumbo, watching your little wimpy 12 footer sail through

Not as long as you all have to wait for the vapor Milan II that was promised by March-like it was last years soup...While the rest of the industry has moved on.. Gee, a certain chunky fella has obviously has hid under a rock..

Newsgroups: comp.sys.atari.advocacy

I have 2 SF354 floppy drives for my 520ST. One of them still works perfectly fine.

The other, however, is getting power, but doesn't seem to spin at all.

My assumption is that there is probably a belt in the drive that either came off or snapped, or is stretched or something.

I opened op the Atari casing, to find the internal floppy drive assembly. Unfortunately, no drive mechanism or belt was accessible. I messed with trying to open the internal drive case itself, but I didn't want to force anything that wasn't supposed to be opened.

I am hoping that somebody can walk me through this and let me know how to get to the portion of the drive I need to access. Or, maybe this is symptomatic of another problem that has a well-known fix.

Finally, is there somewhere that I could just get a cheap replacement for the internal drive that would just plug right up to the power and controller card in the SF354 case?   I'd rather just fix the one I have, but this may be a last resort.

Here are the specs of the drive (since I know they vary widely):
SF354
Serial #: A1645010549
Made in Taiwan
FCC ID: EBA72RSF354
It's the SF354 model where the red light in the front is on the lower right corner, and the disk slot / eject button are "slanted" to match the esthetics of the ST computer.

Let me know if you may be able to help me out. If there are other details about the drive needed to make a diagnosis, let me know and I will provide.

Thanks in advance to anybody who can help!

-Eric

You should be able to replace the mechanism with a standard PC floppy drive. I ran my last STe with a 1.44M floppy quite successfully.

Ah, but the question was speed, not price.

I love BeOS, but really don't care for PC hardware. However, Mac
hardware is overpriced, even second-hand.

Then a Milan is certainly going to be out of their price
range. Furthermore, it IS quite feasable for a kid to
have $300 to blow. That fact is the only reason I was ever

able to buy myself an Atari ST in the 80s.

>enough to purchase a Celeron? A waste of money as far as I am concerned.
>Get a Mac if you want speed and relaibility. Get a PC if you like self
>torture.

You are absurd. On one hand you whine about how some target demographic wouldn't be able to buy a $300 computer and then turn around and suggest that they buy systems that START at $1200 and go into the stratosphere from there.

Beyond the CPU there really isn't much difference these days, actually. A modern Macintosh is pretty much just another PC with a PPC chip in place of a Pentium.

It all depends on what you're running. This is why an 060 could even be considered. PC hardware doesn't require bloat, it just tends to be bundled with it by default.

Seeing as I only have to boot it up once or twice a day this isn't really an issue for me.

> What do you do while you wait for your PC to boot up after a crash?

See my reply to the first comment.

> What do you do while you wait for 10mb applications to download?

I buy one of the many PC mag's with a coverdisk that contains heaps of PC software.

> What do you do when you find out your 200 mmx is slower than a Milan
> 060?

My P233MMX with USB is worth about $150. How much is a new Milan?.

> You buy an Atari Clone.

No. You buy an outdated '060 Atari clone because you love the platform and don't at all care for the fact that faster, cheaper and well supported PC's are available.

When you buy an Atari clone it is definetely not a choice based on a performance figure, but rather an expression of individuality and personal choice. Same for all the other minority platforms.

Regards,

Clockmeister.

Mikey wrote:

Hello Mikey,

> Because MiNT and NAES blows Windoezs off the hard disk.

MiNT is there any support left for then ?
NAES is specify designed for the atari to remove their design flaws !

> What do you do while you wait for your PC to boot up?

On my atari I had to use a boot manager that cost time too. And if I was dumb enough to install another OS it wouldn't take as long. At least I have an OS which supported by millions of recents programs instead of a few hundred. (hundred that is kind friendly of me)

> What do you do while you wait for your PC to boot up after a crash?

Oh yeah , and all those beta versions of atari OS-es don't crash.

> What do you do while you wait for 10mb applications to download?

Just enjoy of browsing with Netscape anc chatting with Mirc , knowing if I don't like these programs I can choose out at least five other programs to chat or to browse. I just download the Halflife OF demo (about 70 MB) and didn't regret. At least I have the choice.

> What do you do when you find out your 200 mmx is slower than a Milan
> 060?
> You buy an Atari Clone.

In what becoming obsolete ?
Serously the motorola 68060 isn't faster than a intel 200 mmx. Its a common misunderstanding under atari users. Read a good book about computer architecture and you'll know. A good book would tell that the motorola series was about 2 times as fast.
as a 486 comparing to clock speed. (that means a 486dx100 is to compare with a 68040) But... , this doesn't count for the intel pentium series because they a much improved architecture. Taking in respect that the motorola has a better FPU , you can compare it with a pentium 75 or so and the over clocked 68060 at 120 MHz to a pentium 150.
But with bigger programs it is even worse for motorola because of the outdated 32 MHz external bus comparing to the 66 Mhz bus of the 200 mmx. (Big programs need to acces the memory chips a lot more)

The CPU is where it amtters and RISC technology is inherently
faster and better, so PPC is indeed better than Pentium.

you are not making any sense.
limited in the sense that the supply of ataris are limited(no onger
being produced?)
or limited in the sense that there are only a certain number of
musicians to go around?
or limited in the sense that there are only so many intelligent people
alive at any one time there fore the market for ataris is limited to
this group?

what, in your definition, is a limited market?

ken

No it isn't. A PPC clock for clock, using non cooked
benchmarks is about 20% faster clock per clock than
a PIII. However, you can get a twice clocked PIII or
K7 and get one in a complete name brand system for
about the same price as (half clocked) Apple system.

The IA32 has economies of scale on it's side. Intel
has competition from AMD to keep it from dragging it's
feet too much. Whereas Apple has always been happy to
gouge you by charging 2x as much for the same parts as
others sell.

BTW, the K7 has 'all of that RISC goodness too'. So do
the sparc and alphas. Even those still manage to deliver
more bang for the buck.

so what you are saying is that you can buy two or three times as much
shit for the same price as something quality. sorry, shit is still shit,
no matter how much of it you have. Unless you are someone who thinks
lots of shit is better than no shit.

> >PC stuff is dirt-cheap or free because it is obsolete even before

>   be even remotely useful.

obsolescence is a factor though. When the software you bought a year ago
is no longer supported
because they have new versions out that only run on the 'newer'machines
and you can't afford to upgrade both your machine _and_ the software but
you need to upgrade the hardware again because of this shiny new
software you just have to have cuz it is so kewl but then your other

software runs funny or...
Do not confuse real obselescence which Martin was not talking about with 'marketing'manufactured
obsolescence which he was.

you are the one looking foolish.
pay attention! (or are you just trolling?) to quote above "Second-hand Atari hardware..."
now does that resemble *new* Milans?? In terms of MIDI software 15 year old Atari's are as good as it gets. deal with it. do you have some fetish about progress? that newer _has_ to mean better?
n o t. if that were true then MIDI timing on a modern Celeryon would be beter than Ataris timing, but it isn't.
Milan has absolutely no appeal for you at all, so how can you judge what appeal it would have for others??

```
> --

That's a nice fantasy and all. But you really are quite out of
touch. Except for serious Unix RISC machines, all PCI based
systems are essentially the same sort of crap. This is especially
true for Milans and Apples.

The Milan at least has the benefit of an OS optimized for running
on obsolete hardware. The Macs don't even have that.

>no matter how much of it you have. Unless you are someone who thinks
>lots of shit is better than no shit.

I don't need to be restricted to some overhauled DOS. Thus I can
get quite a bit of quality use out of a cheaper 400Mhz machine.

No it isn't. Either it does it's required task or it doesn't.
Software doesn't wear out. That's why we had all of that Year
2000 BS. Effective software can keep running for decades. I
could still get quite effective use out of a 1993 copy of Amipro
if I really wanted to.

>because they have new versions out that only run on the 'newer'machines

Yes. I actually like being able to run in 1600x1200 in 24million
colors, do video capture and overlay, download spiffy sorenson
media and convert it to cinepak (so I can play it natively), and
exploit 3D acceration hardware.

>n o t. if that were true then MIDI timing on a modern Celeryon would be
>beter than Ataris timing, but it isn't.
>Milan has absolutely no appeal for you at all, so how can you judge what
>appeal it would have for others??

Actually, I wouldn't mind having access to a reasonably priced
Milan motherboard. Most of what I run is available as source so
I'm quite flexible.

Although, being 'just another PC' it would likely have the same
problems as a WinTel PC would with MIDI. Then again there is Be,
specifically geared for realtime and audio production. You're
just too obstinant to try it, even to just get enough to of a clue
to criticise it from an informed point of view.

[deletia]

That's foolish.

let me say that EVERY operating system is designed to remove 'perceived
flaws' in previously
existing operating systems. Name ONE that isn't!

>
> > What do you do while you wait for your PC to boot up?

you used the boot manager IF YOU CHOOSE to. where is the choice with PC?

At least I have an OS
> which supported by millions of recents programs instead of a few hundred.
> (hundred that is kind friendly of me)

no. hundred is being unknowing, or maybe you think sarcastic?? must be,
you say millions of recent programs. not very factual. but true there
are more programs for PC, this is because there are more users.

> > What do you do while you wait for your PC to boot up after a crash?
>
> Oh yeah , and all those beta versions of atari OS-es don't crash.

you do not mean TOS. Mike was not saying that Atari do not crash. He was comparing performance between both systems after they had both crashed. If your atari crashed, was it hard to restart? was there a lot of damage from the crash (i.e. trashed hard drive)? compare this to PC in my experience, not second hand info, not rumours, my own experience,BIG problems sometimes after Windows crash. like no hard drive left, toss it in the garbage heap.
this is very funny eh?

> > What do you do while you wait for 10mb applications to download?

ok, well have fun with your choice. hope you have the hard drive space to store it, the system resources to run it. there is more choice on windows, yes. I have been looking for a couple of weeks for html software, many programs out there, many many more than Atari. still, hard to find a good program, one that I can use, that writes good code. I use an atari emulator to run Edith and qed so that I can iuse kurzels to write html code by hand. not pc programs can do this. oh yes, you have so much choice.

Of course a 200MHz intel is much faster than any atari built yet, faster

than a Milan sure.
The hardware.
now, in the real world we have operating systems. You do too. put
windows on a very fast intel chip. you have a much slower computer for
the end user.
now, you put magic or mint on a 68060. you have a fast computer. faster
than your 200 mmx intel seems for the user. Who cares is you have all
that power if you never see it? don't feel it?

you say big programs need to access memory chips a lot more. true.
but you only have BIG programs in windows on intel because they have to
code so fast for the market they write big fat slow programs. or maybe
they have to match the big fat slow os.

ken

ah, yes. But, since you are such an expert on the workings of the sinclap Random String Generator (to be referred upon as the sRSG), maybe you can answer some questions I have on it:

1) years ago, it was being referred to here as the sinclap Random Bull**** Generator. Is the sRSG an improvement upon the older sRBSG, or is it a completely different program from the older program? If so, what improvements have you noticed being done between the original and the one we see today?

2) it's been rumoured that the sRSG is running off a Macintosh computer. Why would anyone program an application of so non-existant importance for a respected platform like the Mac? And is it true that previously it was designed to run on an Amiga?

3) about two years ago, the sRSG began suddenly spouting out nonsense attacking a supposedly portly individual called "Chunks". Since this said "Chunks" has been proven not to exist (he is certainly not on the rolls of TAF), what variable could have caused the sRSG to mutate itself to generate attack strings against an imaginary individual?
Is it a mutation of a similar bug in which it claims that imaginary "Atari Jihads" are "out to get it"?

4) what about these rumours I'm hearing that the sRSG is actually a subset of an even larger program called the Steve Jobs Reality-Distortion Field (tm), being run from a large NeXT machine in the basement of an anonymous building in Cupertino, California, USA. Is the sRSG affected whenever the SJR-DF program crashes, or when the main program spouts out similar larger amounts of gibberish that have an effect over a wider area of the population?

5) the sRSG seems to have a problem when it generates its messages in that it is unable to piece together coherent sentences, and mangles the spellings of common everyday words. What are the chances that this obviously glaring flaw can be fixed?

6) the sRSG has taken to pulling articles from web sites and pasting them (badly formatted) on USENet groups. I notice recently that whenever a Canadian replies to it, it has been pulling articles from the National Post website to say how bad we have it in our country. We suspect that the website (and indeed the hardcopy editions) are being polluted by the "Tubby Black" virus. Could the TB virus be a mutation of the sRSG in larger form, and is the sRSG be itself a worm virus? Why has the sRSG

been so attracted to the NP website, especially in light of the fact
that the other Canadian newsites which have not been affected by the TB
virus have been reporting the exact opposite? (We also find it
interesting that the NP web site has not reported that a certain
newspaper baron much unbeloved in this country recently had his lawsuit
against our repected PM thrown out of court, and that indeed it has once
again gone to new heights of screeching against the PM - symptoms eerily
similar to the sRSG in dealing with any USEnet posts that contain the
word "Atari" or "TOS")

I await your respected opinions on the above queries.

We use 64 meg, P233's at work, running Windog NT�, and I'm here to tell
you that they are sloooooowwwww...

In fact, my Nemesized Falcon running MiNT felt much more responsive.
This is from first hand experience, so I can just imagine how much
faster an 80mhz '060 Milan running MiNT would feel! ;-)

Later...

Good Answer, because this is the nature of the market today. Using other
platforms such as Atari, we focus on economies of Scope.

Exploitable economies of scale.

Wouldn't have thought to use that first word. Sums things up perfectly.

Brian.

     Stuff gets cheaper when you can sell 50 million units.

     Stuff gets cheaper when there are multiple sources each
          applying competition pressure on each other.

     The 68060's themselves probably cost an arm and a leg. 680x0's
     have always been relatively more expensive than similar x86's.

600Mhz Athlons are about $800 these days. So it is quite likely
that you could get an adequately performing (under NT5) PC system
for as much as a Milan goes for.

     That's not surprising. NT is the least responsive PC OS I can
     think of. That's why I suggested that people take a look at
     Be. Linux is also more responsive (than NT) but it's still rather
     bloated in comparison to GEM and is not optimized for hard realtime
     (like Be). Plus, a musician might stand a better chance of finding
     suitable apps under Be.

Point being that for the same price as a new Milan, you can buy PIII which blows an '060 away.

Question is: Are you judging speed only by perceived OS responsiveness and not pure number crunching performance?.

This thread seems to be going in circles ;-)

Regards,

Clockmeister.

Why, then, are RISC chips moving away from pure RISC (one size for everything, one way of encoding instructions) towards something more CISC-ish? (Variable length instructions, more than one instruction in one instruction word)

And why are CISC processors moving more towards this same target? Even the Pentium is abandoning the "everything is a multiple of 8-bits" philosophy, and moving towards the "multiples of 16 bits" for its instructions, data etc (I cannot recall when this is supposed to happen, though - perhaps in the 5+ years overdue 64-bit x86 [aka 80686, "686"] scheduled to appear in 1995)

I can't that wasn't point I was just trying to say what you're saying to Mikey

...

> > On my atari I had to use a boot manager that cost time too. And if I was dumb
> > enough to install another OS it wouldn't take as long.
>
> you used the boot manager IF YOU CHOOSE to. where is the choice with PC?

IF I CHOOSE ??? ;) I'm speaking as former atari ST user, maybe for later models it
isn't that bad, but I really needed the boot-manager because I didn't want to copy
things in and out of the auto-folder every time I booted up.
If I choose to boot up on MS-dos partition it boots up in a about a second or
two.Windows 98 is booting up much slower thats true , but one of the reasons is not
windows but all the other programs which are started and the beginning too, and
customized icons and the drivers for all kind of hardware you can't run on an atari.
And there a some very easy speedups you know like defragmenting once in a while.
I hope you not refering to a rom-based OS. Because history has proved that isn't
vey handy to have a OS in roms.

> At least I have an OS

> are more programs for PC, this is because there are more users.

I said RECENT programs . No unfortunately I'm NOT sarcastic. Hundred isn't very
factual either it's probably to high estimated. I still do visit atari sites once
in a while you know.

...

> comparing performance between both systems after they had both crashed.

Huh, no hard drive left ? This is highly inprobable, tell me how it happened and
probably if you do the samething on an atari OS it will happen too. Didn't install
a virus protection ???? (That is a real disavantage of much used OS :( )

Second-hand information? Of course, you mean the cute little bombs ! (sorry I'm
sarcastic here) If you would know windows better, than you would know that all
kinds of utillities like DR Watson , scandisk and a bootlogger to detect what the
problem is

> toss it
> in the garbage heap.
> this is very funny eh?

The worst thing that can happen is that you have to format the hard drive again,
Still annoying, but if the USER does something wrong it can happen on a atari too.

>
> ok, well have fun with your choice. hope you have the hard drive space

> have so much choice.

Huh, ever hear about notepad ?????(and the hundreds of replacements). I know
a diehard HTML-er which use this programmy for more than 3 year in a row now an.
Or
even dosedit in window is possible !

> > > What do you do when you find out your 200 mmx is slower than a Milan

>
> Of course a 200MHz intel is much faster than any atari built yet, faster
> than a Milan sure.

Thanks for saying that. Mikey was stressing otherwise. So Mikey, I hope you are
reading this.
On what proccesor based?, the 68060 was build to compete with the low end
pentiums
and there never been a new one to compete with the new processors.
I don't expect that atari/jts will ever release a computer again. So is right to

still call a not 68xxx based computer a atari then ?

> The hardware.
> now, in the real world we have operating systems. You do too. put

> now, you put magic or mint on a 68060. you have a fast computer. faster
> than your 200 mmx intel seems for the user. Who cares is you have all
> that power if you never see it? don't feel it?

The only fair comparision is linux and that doesn't run faster. (I've checked this out)
There are faster OS's for the pc you know. And how many drivers do there exist for Mint and Magic ? Any 3dfx support yet ? Or a driver for you're ordinary PCI sound card?
And I think it isn't fair to compare a OS with a lot less functionality in it with
the speed of windows.

> you say big programs need to access memory chips a lot more. true.
> but you only have BIG programs in windows on intel because they have to
> code so fast for the market they write big fat slow programs. or maybe
> they have to match the big fat slow os.

New Linux programs most of the time are even bigger. Programs get bigger because company spend much time making it. Thats not wise for an atari developer is it ?
For your information, there are for example browsers for windows which are a lot smaller , but they don't have the functionality of Netscape. You could call a new Atari program/OS big too comparing to a 8 bit, but you have admit the new programs are better don't you ?

Greetings
Erik Karsies

> one we see today?

Well-observed. You're absolutely right. Several years ago it carried the title of BS generator, but since it is evidently also capable of generating sentences of extreme hilarity (for their pointless views and mis-interpretation of everything), it's more appropriate to describe it as a random *string* generator. Those strings may, of course, also contain character and word combinations that when interpreted according to a particular set of language rules, means plain ol' BS. They may even produce beautiful music if loaded into a sample player (see Danny McAleer's "Audio ABCs" article in Atari Computing issue 4, page 21).

This is a close analogy to the theory that a group of monkeys with typewriters and infinite time, could produce the entire works of Shakespeare. They would also produce lots of BS and lots of instances of "Atari" and "TOS" but not necessarily in a construct of any meaning.

To summarise the principal differences between the old sinclap BSG and new RSG is simple: The new version is multi-threading, for those really wicked pranksters with high-end workstations, and in terms of its functioning, it has developed a large degree of artificial stupidity.

> 2) it's been rumoured that the sRSG is running off a Macintosh computer. Why would anyone program an application of so non-existant importance for a respected platform like the Mac? And is it true that previously it was designed to run on an Amiga?

The sinclap algorithm was originally developed at Berlin Technical University by a doctor whose name escapes me at this moment. Like any logical algorithm, it may be adapted to execute on any digital computation system, so modern computers are an ideal hosting environment to thrash the sinclap String Engine (not to be confused with Sony's PlayStation 2 Emotion Engine, an infinitely more exciting and useful thing).

Like a virus, the sRSG got to spread and evolve/reproduce in many ways. Some are malicious, some are purely academic (it's one of the UK's top 3 Computer Science final year project studies, and one hardcore German computer magazine even published C sources so readers could program their very own sinclap Random String Generator).

So the sRSG exists on many platforms, and perversely, with Apple's new super-duper G4 "Supercomputer" machines, its high CPU demand makes it an ideal benchmark for the latest generation of high performance microprocessor cores. Some old benchmarking programs would suffer severe internal integer/FP overflow when executed on new CPUs and MPP (Massively Parallel Processing) arrays. It would be interesting to see how the score of 3.2 sinclaps on a 500MHz G4 would compare to the million-processor research machine currently in development at IBM. It could well smash the magical 1 TERASLOPS (trillion SincLap Operations Per Second) barrier, not accounting for compiler optimisations.

> 3) about two years ago, the sRSG began suddenly spouting out nonsense attacking a supposedly portly individual called "Chunks". Since this said "Chunks" has been proven not to exist (he is certainly not on the rolls of TAF), what variable could have caused the sRSG to mutate itself to generate attack strings against an imaginary individual?

Pure co-incidence that the random output at that time appeared to have a negative bias towards the imaginary "Chunks".

> Is it a mutation of a similar bug in which it claims that imaginary
> "Atari Jihads" are "out to get it"?

Not a bug at all, see above.

> 4) what about these rumours I'm hearing that the sRSG is actually a

> the sRSG affected whenever the SJR-DF program crashes, or when the main
> program spouts out similar larger amounts of gibberish that have an
> effect over a wider area of the population?

No. A larger and more processor-intensive program than sinclap RSG could not possibly run at a sensible speed on those NeXT boxes, unless someone has worked out a way for it to invade and multiply on networks, and be able to pass parameters between processors without consuming so much network bandwidth with its remote process initialisation that it becomes even slower to run it on distributed processors.

> 5) the sRSG seems to have a problem when it generates its messages in

Hi there,

JEDIDIAH wrote:
>

> on obsolete hardware. The Macs don't even have that.

Afraid I have to add sixpence worth here...

Your labelling of Milan as 'obsolete hardware' is just a little tongue in cheek am I correct? The Milan represents what is top-of-range for an Atari user, so how can it be obsolete? Yes it uses PCI and other tech that have been around the PC/Mac world for some time, but the key issue is that these technologies have not been used much previously in the Atari world. That world is completely removed from the world of PC/Mac, so what is labelled redundant or obsolete on PC/Mac is not necessarily so on Atari don't you think?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sure, until you want to run the latest games, play or encode MP3's whilst
doing other things, DVD, render some stuff, emulation... you get the
picture. There are plenty of different OS's available for the PC so you're
not just limited to Windows.

```
> and if the hardware catches up? WATCH OUT! smell those burning
> synapses?? :-)

Yes, if it catches up. A 1Ghz Athlon is somewhat faster then any '060 though
;-).

Be is a bit behind. They only just got CivCTP. But Linux has
Unreal Tournament, Quake3, Heavy Gear II, Heroes of Might &

```
     Magic III, Railroad Tycoon II Gold, Myth II, CivCTP with
     Solder of Fortune, Jagged Alliance 2, SimCity 3000,
     Alpha Centauri, Shogo & SiN in development.

     Shogo & SiN are also being ported for the Amiga.

     We're also talking about the Milan... an 060 that goes for
     about as much as a new K7/600 system tends to go for these
     days.

[deletia]

     The Falcon or TT hasn't really ever been as 'new' as it gets.
     Cloning or 3rd party upgrades have always been around.

So it represents 'top of range for an "Atari on 0x0 user'.
Considering that even under emulation, a much faster PC or Mac
likely has cycles to spare: a Milan is probably not the absolute
top of the line when it comes to running GEM 68K binaries.

>have been around the PC/Mac world for some time, but the key issue is that

>don't you think?

Nope. Low resolution and low color with limited expansion options
is no less that even if it is the best you think you can manage.

Get out of your fantasy land. Intel and AMD are pushing each other harder and harder to increase their performance and lower their prices while Apple and Motorola just sits on their laurels.

The benchmarks that do show a significant performance advantage to PPC's are quite cooked and a mostly a product of apple marketing.

Even if you accept the notion that clock for clock a PPC is thrice faster, you can still build a thrice clocked PIII that will be price competitive with Apples.

Besides, the K7 is indeed a RISC core. So blind faith in the relative utility of RISC doesn't really necessarily tell you anything in a K7 vs. G4 comparison.

     The only catch with that is Kludge Klones can still deliver
     2x or more cycles for less, even buying name brand hardware.
     Plus you'll have better options and components available and
     possibly get onsite support to top it off.

     Actually, the Amiga's custom hardware imposed some pretty
     heinous engineering limitations. The ST wasn't quite as
     'blown away' as you indicate. Although they (ST/Amiga) both
     made the PC's and Macs look bad.

reality check
last time I looked, I was running in true colur at 800x600 on my Falcon.
I would think that the Milan2 could be doing (easily) 24bit colour at
1024x768.
you refer to this as low resolution and low colour?
PCI, ISA, USB, PS2, SCSI, IDE: this is limited expansion??
motherboard by Motorola.
 now in emulation, yep, very few over 640x480x16.

Or higher, on a Falcon equipped with a CT2B.

> I would think that the Milan2 could be doing (easily) 24bit

The Milan can go as high as whichever PC graphics card you put
in.

> now in emulation, yep, very few over 640x480x16.

Indeed. All current emulators emulate a slightly more colourfull
version on the STE, at best. TT and Falcon enhancements have
never been emulated.

You two are still talking about 1/4th the resolution I
mentioned and not necessarily as much colordepth and that's
not even the extent of what current PC/Mac video hardware
can do.

You don't, but the Milan does. That graphics card is very much a

standard Trio S3 card initially made for the PC market. Drivers
for other manufacturers' cards are also written for fVDI.

Such as?.

The ST wasn't quite as
> 'blown away' as you indicate.

I couldn't get over the fact that the ST had standard MIDI ports (which
didn't interest me) and a shithouse, half arsed Yamaha soundchip (sound
reproduction did interest me). Amiga was far more impressive for me at
least, and I sold my ST.

Ofcourse, people's experiences will differ.

Although they (ST/Amiga) both
> made the PC's and Macs look bad.

That wasn't too difficult at the time though, then again, MacOS is still
handicapped.

My opinion of the S3 Trio is that it has great output, but shithouse
performance.

I hope the video card/driver situation improves for the Milan if the S3 card
is the standard unit.

Then it's rather peculiar that the Milan website doesn't
mention this. One would think that they would want to
cast their system in the best light possible while still
remaining truthful and quite possibly verify compatibility.

There doesn't seem to be a horribly long support list for fVDI either.

I always guessed that the Falcon must have picked up this
nonsense from elsewhere. Now, I know where from.

obviously you have never been to the Milan website, check this out:
http://www.milan-computer.com/gb/products/milanII01.html
which among other things says:Hardware

ATX-Tower
MC68060 with at least 66Mhz, 80Mhz is under construction
64MB-SDRAM (with full Bus-speed access at 66/80Mhz)
Harddrive of 10 GB
SoundBlaster SB64 PCI
ATI Mach 64 with 4MB Videoram, expandable up to 16MB

2x IDE, 3x serial, 1x parallel, 2x USB (hot
plugging!), Keyboard, PS2-Mouse
3x ISA-Slot, 4x PCI-Slot (2 PCI used for graphic-
and sound card)
TEAC Floppy 1,44 MB, 40x CD-ROM (Cyberdrive)

>   There doesn't seem to be a horribly long support list for fVDI either.

in comparison to...?
fVDI is coded by a single individual, I am blown away by what he has
accomplished so far.
That he has any support list at all is amazing. and that he is working
with a commercial developer is astounding!!

     That says Mach 64 a lowend ATI chipset, not Trio a lowend
     S3 chipset. Furthermore, their listing of supported expansion
     hardware lists nothing.

     ...just about anything I would imagine. I have not verified this
     yet but I bet that the Ameoba PPC has more than 2 (lowend) chipsets
     available.

>Your point is what?

You still get more bang for your buck with PC's.

If your computing is userbound, you can massively undercut
Apple pricing. If you need more computing horsepower, you
can still undercut Apple pricing and beat Apple in total
speed as well.

If you need MUCH more computing horsepower, you can just
get a 4-way or 8-way SMP PC if cost is no object.

Milan 040 used a Trio S3. The info should still be somewhere on
the web site.

...I was talking about 1600x1200x24M...

Are you sure the RAMDAC in the Trio can manage that much?

I have an Amiga programmer, a games programmer and an
electrical engineer with no motivation to badmouth the
Amiga that claims otherwise.

Hm!, is this guy a total tosser, i think i know of him, does he spout total
shitte everytime his mouth opens, and does he have an inferiority complex
the size of an elephants asre and looks to match??.

Yeah, I can see it now. Atari engineers looking over the Amiga schematics to
get a clue on how to design a computer.

Regards,

Clockmeister.

I don't believe freaks is meant negatively. Perhaps the term techies
could apply. But really, people looked upon it as a cool games machine
and a fun computer.

```
>> >>

```

Serial Speed, and CPU speed. I had to endure to many instances of just
that. These limits as I have mentioned before, could occur even in LOW
Resolution on an A3000 at 16*320*200.
